
MRSA Screening and Decolonisation UK Experience

**Dr. Kitty Fung
ICO, KEC**

MRSA bacteraemia reports : England 1993–2008

-
- “microbiological screening must **include all elective admissions to an acute trust** irrespective of length of stay (but excluding a few patient categories as listed below)....MRSA colonised or infected patients should have **effective decontamination** and inpatients must be promptly identified and nursed in an **appropriate isolation facility** eg a side room or cohort bay.”

Source:

DH *Screening for MRSA colonisation – a strategy for NHS Trusts: a summary of best practice* (July 2008 and DH Gateway Refs 10324 and 11123)

East of England Strategic Health Authority Operational Guidance (2008)

MRSA screening in UK

- **On selected patients/areas based upon local risk assessment**
- **Those at high risk for MRSA carriage on admission**
(exception: direct isolation with no plan for clearance)
- **Screen before elective admission**
- **Regular (e.g. weekly) screening of all patients on high-risk units**
- **At least 3 screens at weekly intervals before considered to be at low risk**
- **Subjected to regular audit & review, made available to management**

Exclusions for screening

- Minor dermatological procedures
 - Day case
 - Ophthalmology / dental / endoscopy / colonoscopy / sigmoidoscopy / radiological procedures
 - Hysteroscopy / termination of pregnancy/
 - Maternity/obstetrics (except elective caesareans and any high risk cases)
 - Children/paediatrics (unless in a high risk group)
 - Repeat attenders (not every admission)
-

Sites to be screened

- **Multi-site MRSA screening swabs**
 - ❑ **Nose, throat and perineum / groin (plus, umbilicus of neonates)**
 - ❑ **Any wounds, ulcers, pressure sores and intravenous or dialysis access sites +/- catheter urine (CSU)**
 - ❑ **The sites should be swabbed using separate swabs**
-

MRSA screening

Conventional culture

Take days

Molecular testing

Take hours

MRSA decolonization therapy (5-7 days)

- Usually commenced immediately to eradicate the organism or, at least, reduce the patient's load of MRSA, to reduce the risk of transmission
 - **If acute MRSA infection is present, start decolonization therapy only after:**
 1. Completion of antimicrobial therapy and
 2. Removal of infected source if present , e.g. indwelling catheters (urinary, vascular), tracheostomy tubes, implants or other foreign devices
-

MRSA decolonization

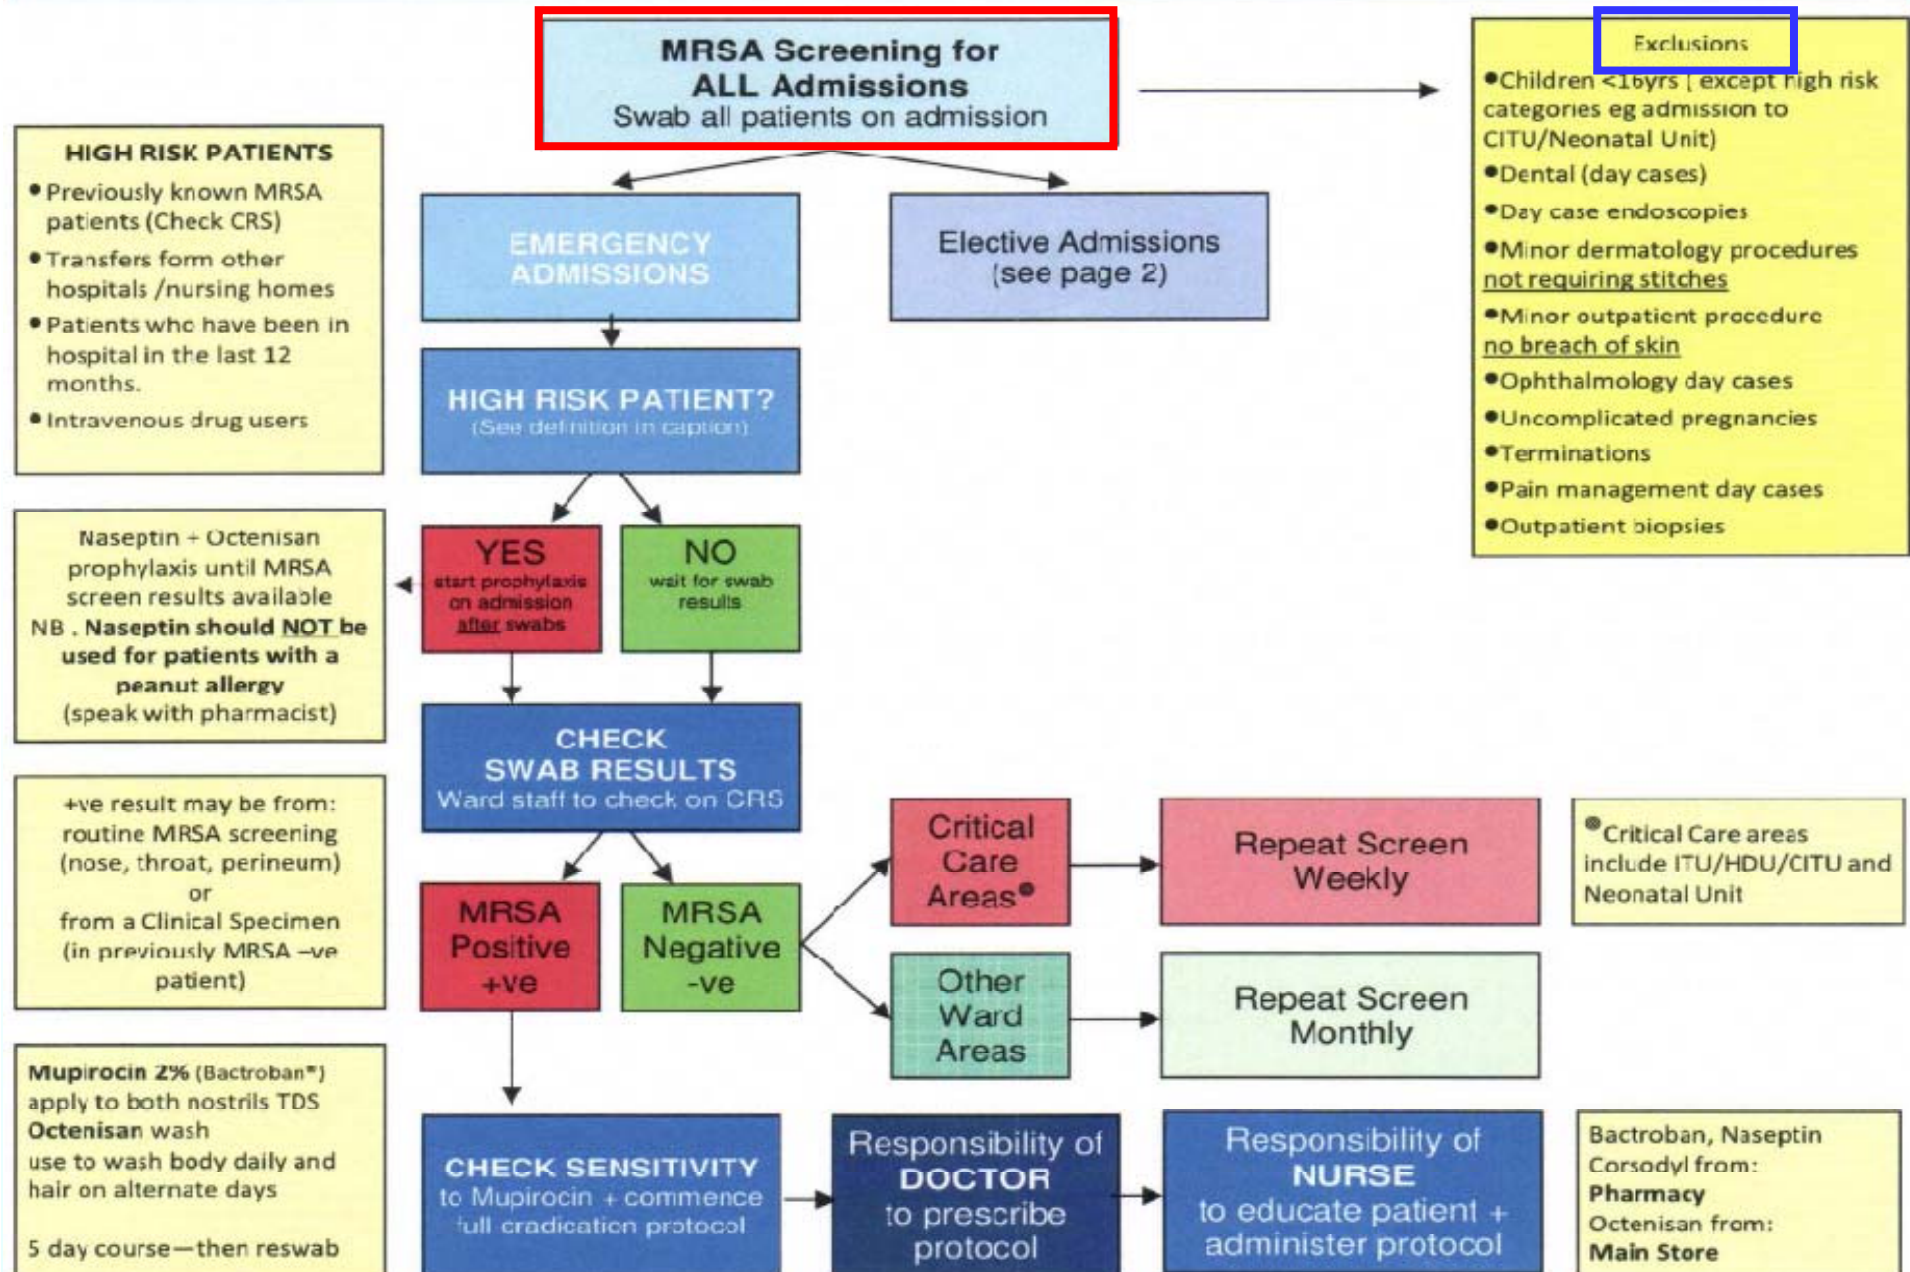

- Around 50-60% effective for long term clearance
 - Normally only two attempts of decolonisation to be undertaken to prevent risk of resistance
 - Beware of skin irritation. The use of emollients may be useful.
 - Bed linen, towels and night wear should be changed daily throughout the treatment period
 - Repeat MRSA screening swabs 48 hours after completion of treatment
-

Decolonization

- **Nasal decolonization (mupirocin 2%)**
 - ❑ Taste mupirocin at the back of the throat after application
 - ❑ Not for >2 courses (risk of resistance)
- **Skin decolonization**
 - ❑ 4% chlorhexidine body wash/shampoo, 7.5% povidone iodine or 2% triclosan
- **Systemic treatment**
 - ❑ In conjunction with nasal mupirocin and skin decolonization
 - ❑ Seek advice from microbiologist, appropriate monitoring [e.g. LFTs], restricted to 1 course

MRSA Screening and Eradication Protocol For **Emergency Patients**

MRSA Screening and Eradication Protocol For Elective Patients

Decolonisation Protocol:

1. Octenidine (Octenisan®) wash or Chlorhexidine gluconate 4% cleansing solution (e.g. Hibiscrub®) for daily wash and alternate days hair wash

2. Mupirocin 2% (Bactroban®) nasal ointment to be used 3 times a day
or

if the organism is mupirocin resistant:

Naseptin (neomycin sulphate 0.5%+ chlorhexidine hydrochloride 0.1%) may be used four times a day

Naseptin must NOT be used if patient is allergic to peanuts or chlorhexidine. Contact the infection control team for further advice.

Note for clinics: If GP is to prescribe decolonisation, fax a [letter](#) to them along with [patient information leaflet](#).

MRSA Screening for ALL Admissions
Swab all patients on admission

ELECTIVE ADMISSIONS
swab at pre-admission clinic

Emergency Admissions
(see page 1)

CHECK SWAB RESULTS
before admission

MRSA Positive +ve

MRSA Negative -ve

Check for mupirocin resistance

High risk procedure

Low risk procedure

Admit patient for elective procedure

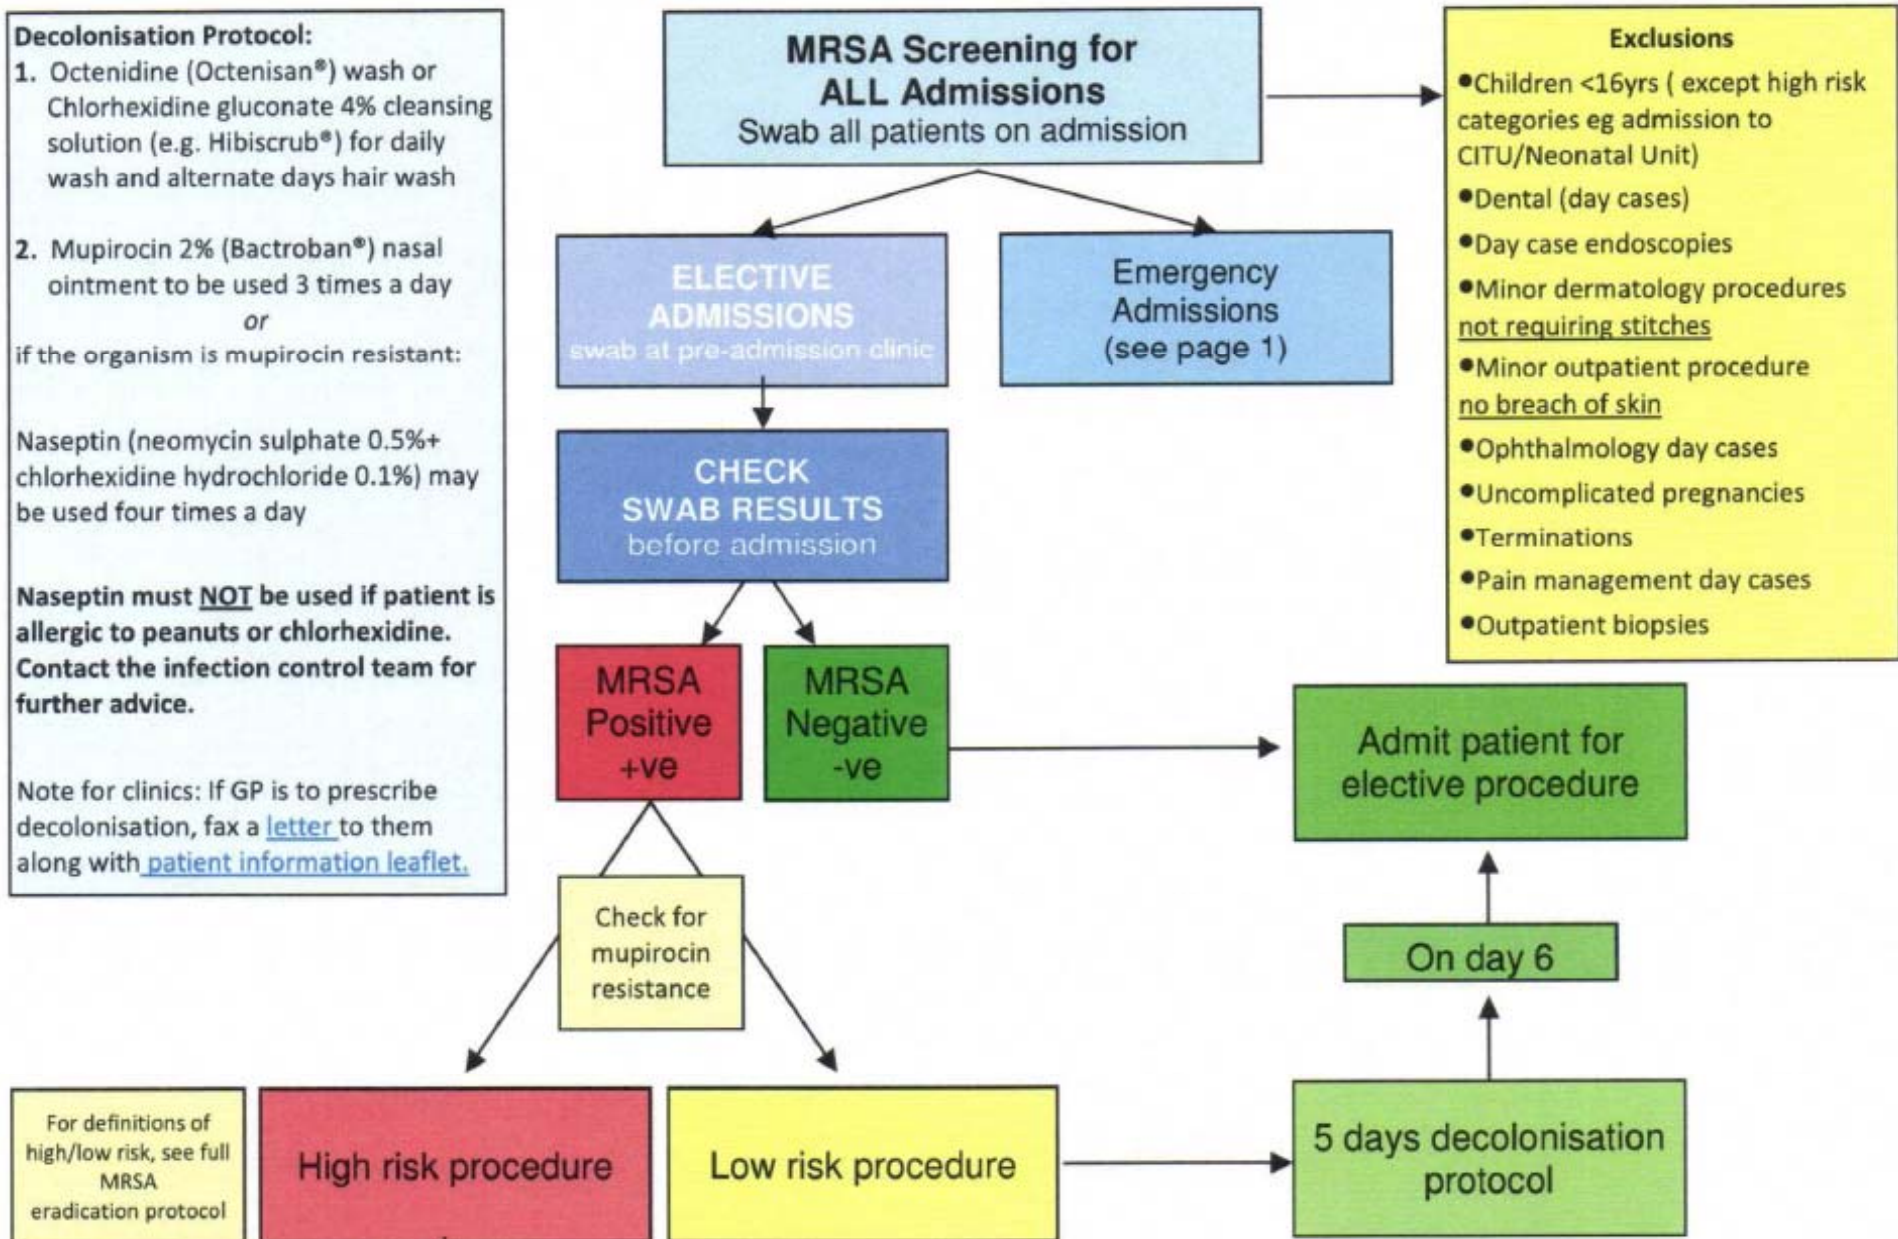

On day 6

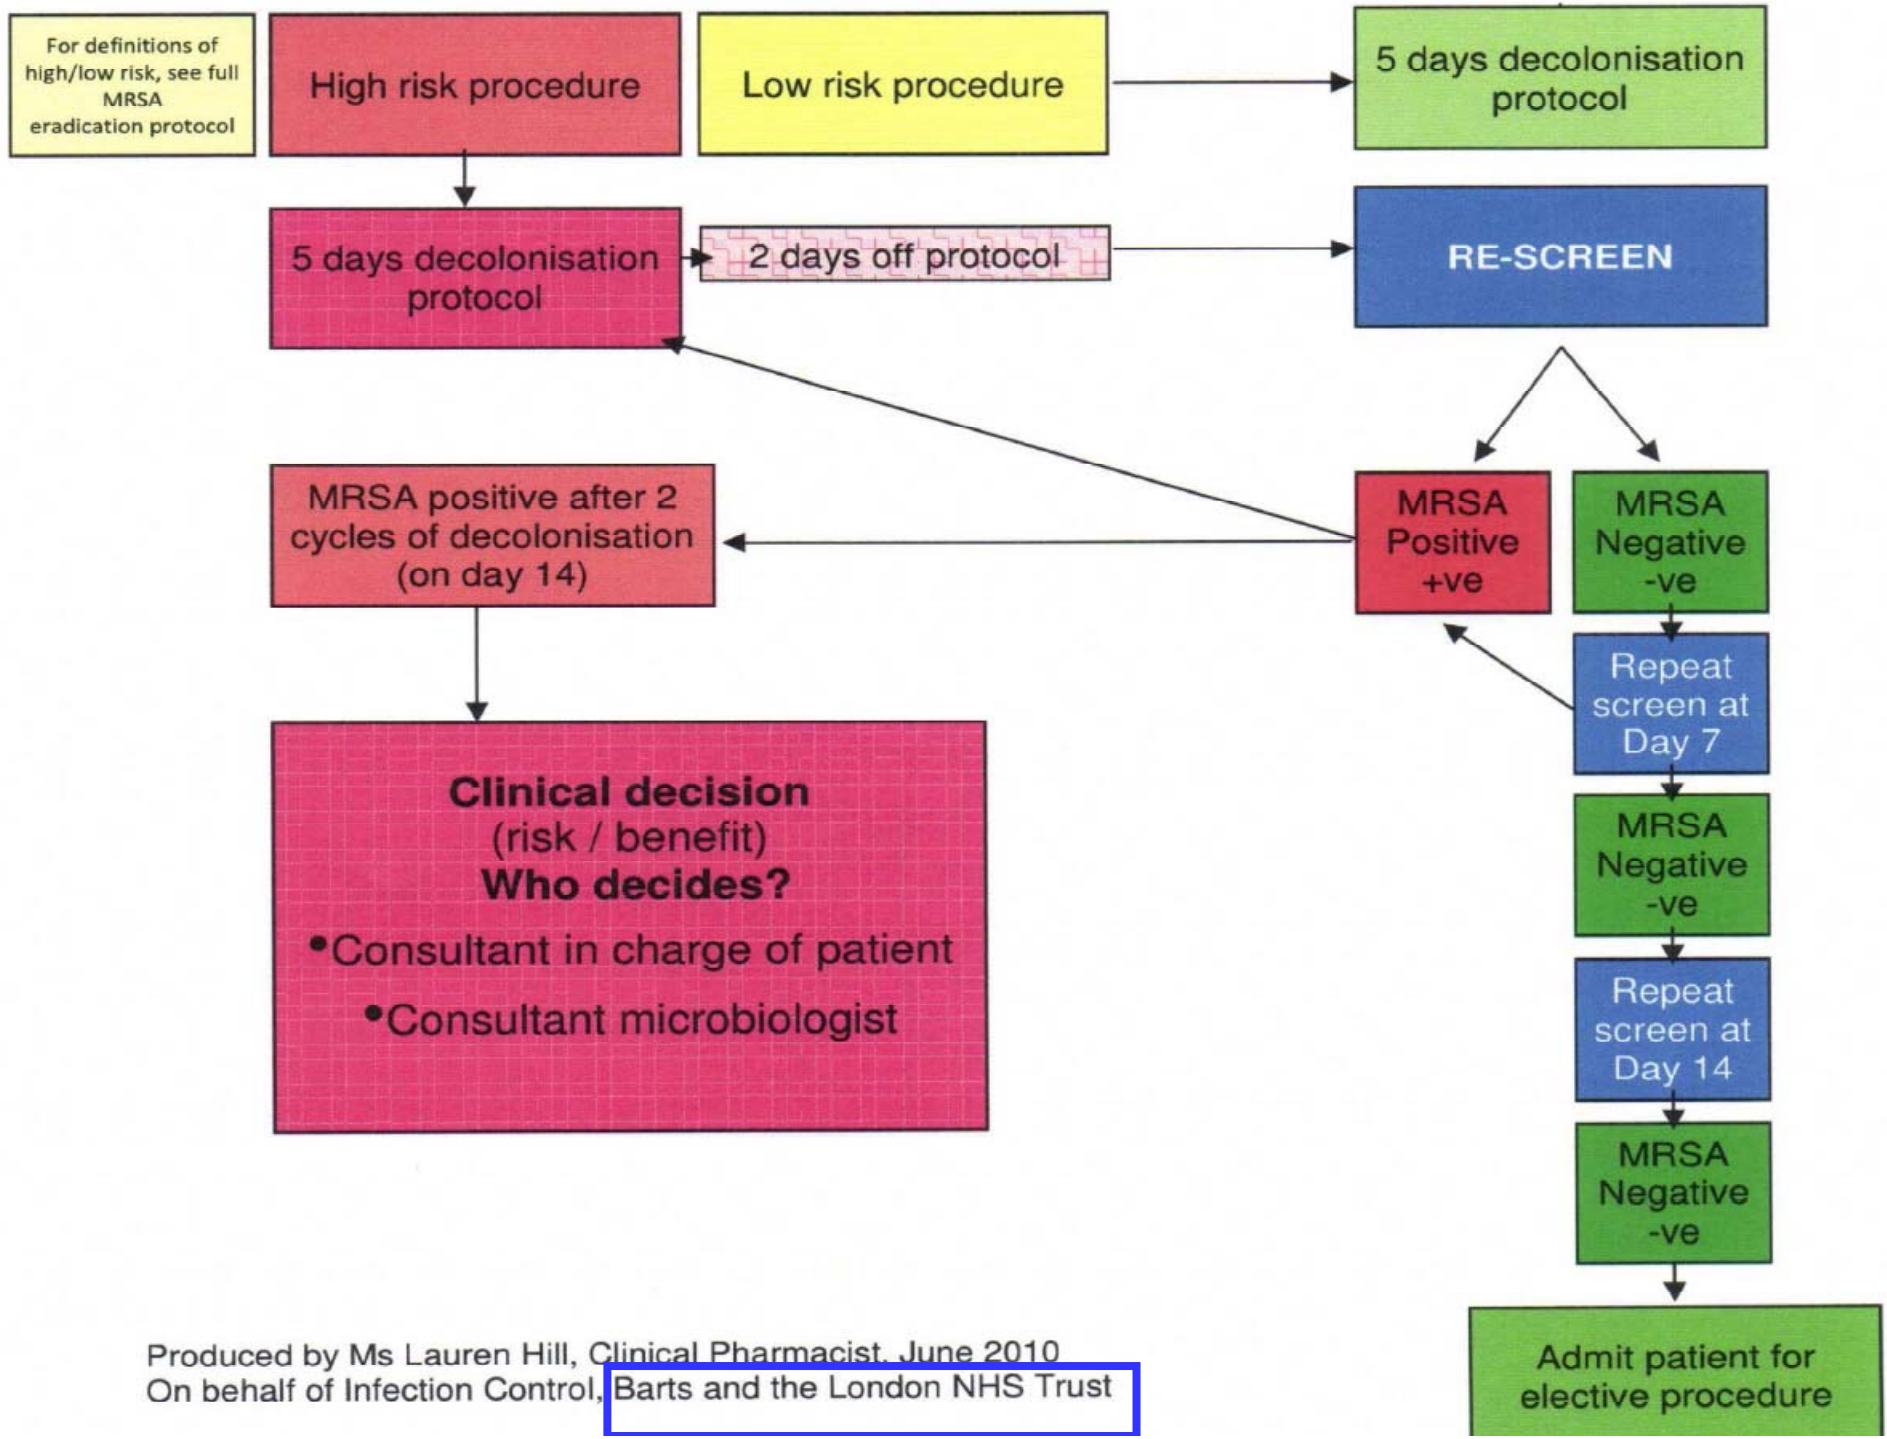

5 days decolonisation protocol

Exclusions

- Children <16yrs (except high risk categories eg admission to CITU/Neonatal Unit)
- Dental (day cases)
- Day case endoscopies
- Minor dermatology procedures not requiring stitches
- Minor outpatient procedure no breach of skin
- Ophthalmology day cases
- Uncomplicated pregnancies
- Terminations
- Pain management day cases
- Outpatient biopsies

For definitions of high/low risk, see full MRSA eradication protocol

 On behalf of Infection Control, Barts and the London NHS Trust

Summary of MRSA control strategies in UK

- **Commitment from government & hospital management**
 - **Target for action (Number of HAI MRSA B'emia)**
 - **Additional resources**
 - **Appoint director for prevention and control of infection**
 - **Attention to environmental hygiene**
 - **Infection control dash reports, regular audit meetings attended by all dept heads and management**
 - **Hand hygiene audit (target at 95%)**
 - **RCA & action plans for MRSA B'emia cases**
 - **Financial penalty, hospital pull down or re-organisation**
-

Thank You
