### Route of transmission of COVID-19

#### **Dr CHEN Hong**

Head, Infection Control Branch, CHP / Consultant-in-charge, IDCTC, HAHO

19 March 2020

### Coronavirus Disease 2019 (COVID-19)

#### Causative agent

 A novel coronavirus is found to be the causative agent, which named as SARS-CoV-2

#### Clinical features

- Symptoms of the cases include fever, malaise, dry cough and shortness of breath
- Some cases were in serious condition
- People of older age or having underlying disease are at a higher risk of deterioration into serious condition

#### Incubation Period

 Estimated range from 1 to 14 days, most commonly around 5 days

Courtesy of CDC

### Coronavirus Disease 2019 (COVID-19)

- Routes of transmission
  - The main mode of transmission is through respiratory droplets
    - Droplet transmission: when the mucous membrane of the eyes, nose and mouth of a susceptible person come into contact with infectious respiratory droplets
  - Can also be transmitted through contact
    - Direct contact: direct contact with secretions or other body fluid
    - Indirect contact: contact with contaminated object or environment

#### Prevention

 There is no vaccine for this infectious disease at the moment

#### Daily life

 To maintain at all times strict personal and environmental hygiene is key to personal protection against infection and prevention of the spread of the disease in the community

#### During work

 Strictly comply with IC recommendations, especially HH and appropriate use of PPE

### Hand Hygiene

Hand hygiene is the single most important measure of reducing the spread of diseases.

- Perform hand hygiene frequently.
- Wash hands with soap and water when hands are visibly dirty or visible soiled with blood, body fluid, after using the toilet or changing the diapers.
- When hands are not visibly soiled,
   70-80% alcohol-based handrub is also an effective alternative.

Rub hands for at least 20 seconds

### Hand hygiene technique

### Personal Protective Equipment (PPE)

 The primary use of PPE is to protect healthcare workers and reduce opportunities for transmission of microorganisms in healthcare facilities

 Appropriate use of PPE can safeguard oneself and the others

### Appropriate of PPE

• Routes of transmission

# WHO - The COVID-19 Risk Communication Package For Healthcare Facilities

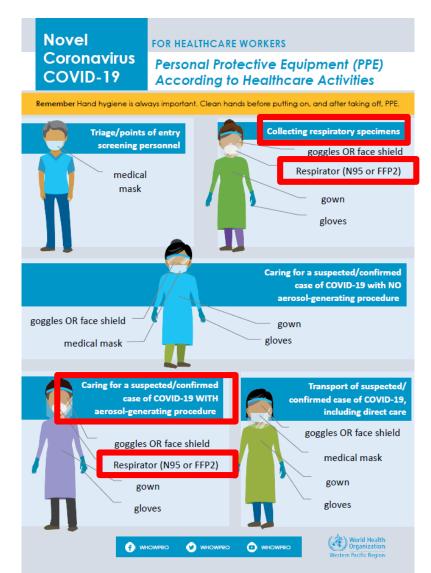

Updated March 2, 2020.

This toolkit is designed to be easily edited, printed and shared. The layout is suitable for any ISO-sized paper (A4, A3, A2).

Images and text have been separated so the layout can be adjusted depending on the requirements.

To print, export the files as PDF or PNG and send to the printer. For borderless printing, the image may be scaled to fit the printable area and trimmed along the edges.

CHP - Recommended Personal Protective Equipment (PPE) in hospitals/clinics under Serious/ Emergency Response Level Coronavirus disease (COVID-19) (Interim)

Recommended Personal Protective Equipment (PPE) in hospitals/clinics under Serious/ Emergency Response Level
Coronavirus disease (COVID-19)
(Interim)

Recommended Personal Protective Equipment for routine patient care and performing aerosol-generating procedures in hospitals/clinics under

Serious / Emergency Response Level.

Apply Standard Precautions +/- transmission based precautions for all patients				
Areas	Activities	Serious Response Level	Emergency Response Level	
		Recomme	ended PPE	
High-risk patient areas I. Triage stations of Out-patient Clinics and AEDs	Routine patient care and aerosol- generating procedures (a,b)	Surgical mask eye protection (a) gown gloves cap(optional)  Use N95 respirator when performing aerosol- generating procedures.	Surgical mask eye protection (4) gown gloves cap(optional)  Use N95 respirator when performing aerosolgenerating procedures.	
High-risk patient areas II. Designated clinics III. Isolation rooms (including isolation rooms in ICU and AEDs)	Routine patient care and aerosol- generating procedures (A.b)	N95 respirator eye protection (4) gown gloves cap(optional)  Use N95 respirator when performing aerosol- generating procedures.	N95 respirator eye protection (4) gown gloves cap(optional)  Use N95 respirator when performing aerosolgenerating procedures.	
	No patient contact (e.g. outside patient room)	Surgical mask	Surgical mask	
	Routine patient care	Surgical mask, Standard Precautions +/- transmission based precautions	Surgical mask, Standard Precautions +/- transmission based precautions	
Other patient areas	Aerosol- generating procedures (a.c.e)	N95 respirator eye protection (4) gown gloves cap (optional)	N95 respirator eye protection (d) gown gloves cap (optional)	
	No patient contact	Surgical mask is required in patient areas	Surgical mask is required in ALL areas	

### Why not always N95?

ACTA NEUROLOGICA SCANDINAVICA

#### According to a study in Singapore involving 212 health care workers

#### continuous use of the N95 face-mask exceeding 4 hours were associated with development of headaches.

# Headaches and the N95 face-mask amongst healthcare providers

Lim ECH, Seet RCS, Lee K-H, Wilder-Smith EPV, Chuah BYS, Ong BKC. Headaches and the N95 face-mask amongst healthcare providers. Acta Neurol Scand 2006: 113: 199–202

© 2006 The Authors Journal compilation © 2006 Blackwell Munksgaard.

Background: During the 2003 severe acute respiratory distress syndrome epidemic, healthcare workers mandatorily wore the protective N95 face-mask. *Methods:* We administered a survey to healthcare workers to determine risk factors associated with development of headaches (frequency, headache subtypes and duration of face-mask wear) and the impact of headaches (sick days, headache frequency and use of abortive/preventive headache medications). Results: In the survey, 212 (47 male, 165 female) healthcare workers of mean age 31 years (range, 21–58) participated. Of the 79 (37.3%) respondents who reported face-mask-associated headaches, 26 (32.9%) reported headache frequency exceeding six times per month. Six (7.6%) had taken sick leave from March 2003 to June 2004 (mean 2 days; range 1-4 days) and 47 (59.5%) required use of abortive analgesics because of headache. Four (2.1%) took preventive medications for headaches during this period. Multivariate logistic regression showed that pre-existing headaches [P = 0.041, OR = 1.97 (95% CI)]1.03-3.77)] and continuous use of the N95 face-mask exceeding 4 h [P = 0.053, OR = 1.85 (95% CI 0.99-3.43)] were associated with development of headaches. Conclusions: Healthcare providers may

development of headaches. *Conclusions:* Healthcare providers may develop headaches following the use of the N95 face-mask. Shorter duration of face-mask wear may reduce the frequency and severity of these headaches.

### Why not always N95?

#### 3. N95/N100口罩

梁宗存表示,N95口罩中的「95」,是指能隔除95%空氣中的懸浮粒子,因N95口罩的口和鼻位都有橡筋緊箍著,形成密封的狀態,故N95口罩可隔除大部分及較細的污染物。

但許樹昌認為,N100較N95更能阻擋懸浮粒子,但由於PM2.5的體積過於微小、難以完全隔除。由於N95與N100 口罩過於密封,長期帶若半小時後,便容易出現頭痛的問題,不適宜在社區長期使用。

### Summary

- The main mode of transmission of COVID-19 is through respiratory droplets
- To maintain at all times strict personal and environmental hygiene is key to personal protection against infection and prevention of the spread of the disease in the community
- Strictly comply with IC recommendations, especially HH and appropriate use of PPE, can protect staff against the risk of COVID-19 while working in the clinic setting

### What is aerosol?

#### Aerosol refers to particles in suspension in a gas, such as small droplets in air

Nature	Aerodynamic Diameter	Implication on disease transmission		
Droplet Nuclei (Aerosol)	< 5 μm	<ul> <li>Follow airflow streamline, capable of short and long</li> </ul>	Readily penetrates the airways all the way down to alveolar space	
	< 10 μm	range transmission	Readily penetrates below the glottis	
Intermediate Droplet	10–20 μm	<ul> <li>Share some properties of both small and large droplets, settle more quickly than particles &lt; 10 μm and potentially carry a smaller infectious dose than &gt; 20 μm droplets</li> </ul>		
Large Droplet	> 20 μm	<ul> <li>Falling mostly under the influence of gravity</li> <li>Too large to follow inhalation airflow streamlines</li> <li>Surgical masks would be effective as they will act as a direct physical barrier to droplets that are too large to be inhaled into the respiratory tract around the sides of the mask</li> <li>Less likely for depositing and initiating an lower RTI since they will impact onto respiratory epithelial mucosal surfaces or be trapped by cilia before reaching the lower respiratory tract</li> </ul>		

### Aerosol Generating Procedures (AGP)

- Aerosols are produced when an air current moves across the surface of a film of liquid, the greater the force of the air, the smaller the particles that are produced.<sup>1</sup>
- An AGP is defined as any medical procedure that can induce the production of aerosols of various sizes, including droplet nuclei.<sup>1</sup>
- AGPs are procedures that stimulate coughing and promote the generation of aerosols.<sup>2</sup>

## Aerosol Generating Procedures (AGP)

- With documented increased in risk of respiratory infection transmission
  - Endotracheal intubation
  - cardiopulmonary resuscitation
  - Bronchoscopy
  - open suctioning of respiratory tract (including tracheostomy care)
  - autopsy
  - non-invasive positive pressure ventilation (BiPAP & CPAP)
- With controversial/ limited studies evaluating the risk of respiratory infection transmission
  - high-frequency oscillatory ventilation
  - nebulizer therapy
  - sputum induction
- Nasopharyngeal aspiration (NPA) and high flow oxygen are theoretically at risk of dispersal of infectious respiratory droplets, therefore they should be performed in conditions as required for aerosol-generating procedures in high-risk patient areas
