Case fatality rate of COVID-19 in China

Baseline characteristics	Confirmed cases, N (%)	Deaths, N (%)	Case fatality rate, %
Overall	44,672	1,023	2.3
Age, years			
0–9	416 (0.9)	–	–
10–19	549 (1.2)	1 (0.1)	0.2
20–29	3,619 (8.1)	7 (0.7)	0.2
30–39	7,600 (17.0)	18 (1.8)	0.2
40–49	8,571 (19.2)	38 (3.7)	0.4
50–59	10,008 (22.4)	130 (12.7)	1.3
60–69	8,583 (19.2)	309 (30.2)	3.6
70–79	3,918 (8.8)	312 (30.5)	8.0
≥80	1,408 (3.2)	208 (20.3)	14.8
Sex			
Male	22,981 (51.4)	653 (63.8)	2.8
Female	21,691 (48.6)	370 (36.2)	1.7
Occupation			
Service industry	3,449 (7.7)	23 (2.2)	0.7
Farmer/laborer	9,811 (22.0)	139 (13.6)	1.4
Health worker	1,716 (3.8)	5 (0.5)	0.3
Retiree	9,193 (20.6)	472 (46.1)	5.1
Other/none	20,503 (45.9)	384 (37.5)	1.9

The Novel Coronavirus Pneumonia Emergency Response Epidemiology Team. ***China CDC Weekly****. 2020;2 (8): 113-122*

Clinical info

- **1099** patient in China
  - Median Age 47.0 years,
  - 42% were females.
- Direct contact with **wildlife**: 1.18%
- Travel to Wuhan 31.3%
- Contacted with people from Wuhan 71.8%
- Symptoms:
  - **Fever on admission: 43.8**%
  - **Fever during hospitalization: 88.7**%
  - Cough 67.8%
  - Fatigue 38%
  - Sputum 33.7%
  - SOB 18.7%
  - Myalgia/Arthralgia: 14.9%
  - Vomiting 5%
  - Diarrhoea 3.7%
- Median **incubation** period**: 4d** (IQR 2-7d)
- HCW 3.5%

- **Severe case**: 173 (**15.7%**)
- CT abnormality on admission: 86.2%
  - ground-glass opacity 56.4%
  - Bilateral patchy shadowing 51.8%
  - Local patchy shadowing: 41.9%
  - Interstitial abnormality: 14.7%
- Lab info:
  - Lymphopenia 83.2%
  - Thrombocytopenia 36.2%
  - LDH > 250: 41%
  - ALT > 40: 21.3%
  - CK > 200 IU: 13.7%
  - Cr > 133 1.6%
- Outcome:
  - ARDS 3.4%
  - needed oxygen 41.3%
  - NIV 5.1%
  - IMV 2.3%
  - ICU 5%
  - Died **1.4%**

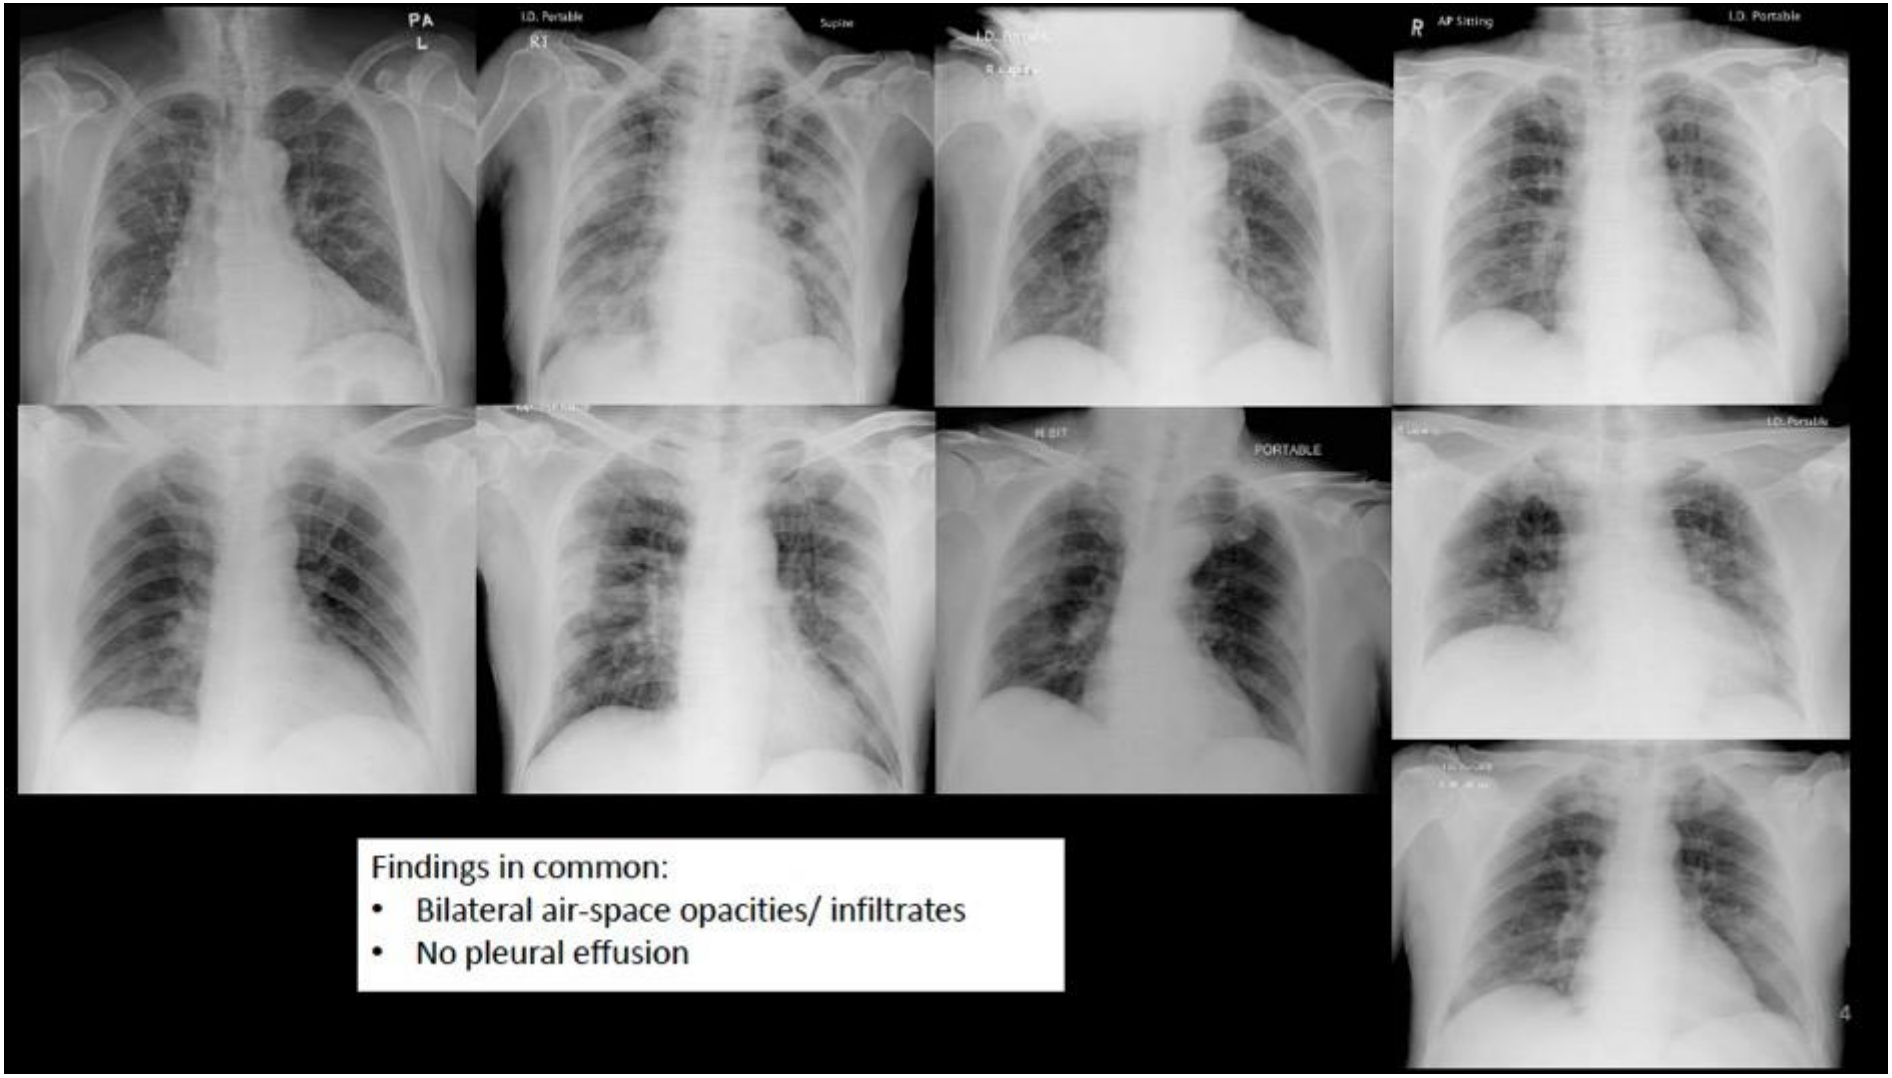
Summary of clinical info of PMH cases

- **Typical for viral pneumonitis**
- **WBC N or low, Lymphopenia, even for severe case**
- **ALT slightly up**
- **LDH correlate with disease activities**
- CRP high for severe case
- Could have mild myositis
- Normal: RFT (except for 1 requiring CVVH), Clotting, PCT
- Viral load High in NTS/TS for severe cases also viraemia in severe case

Radiological findings

Typical CXR findings



Courtesy of Dr SK Li & Dr YC Lee (Department of Radiology, PMH)

The Key +ve CT Findings

1. Ground-glass opacities (100%)
2. Involvement of multiple lobes (100%)
3. Subpleural or peripheral distribution (often central-sparing) (100%)
4. Consolidations (77.8%)
5. Septal thickening (55.6%)
6. Bronchial dilation and wall thickening (55.6%)

Courtesy of Dr SK Li & Dr YC Lee (Department of Radiology, PMH)

The Important –ve CT Findings

1. Pleural effusion (0%)
2. Lymphadenopathy (0%)
3. Lung nodule (0%)
4. Specific zonal predominance (variable)

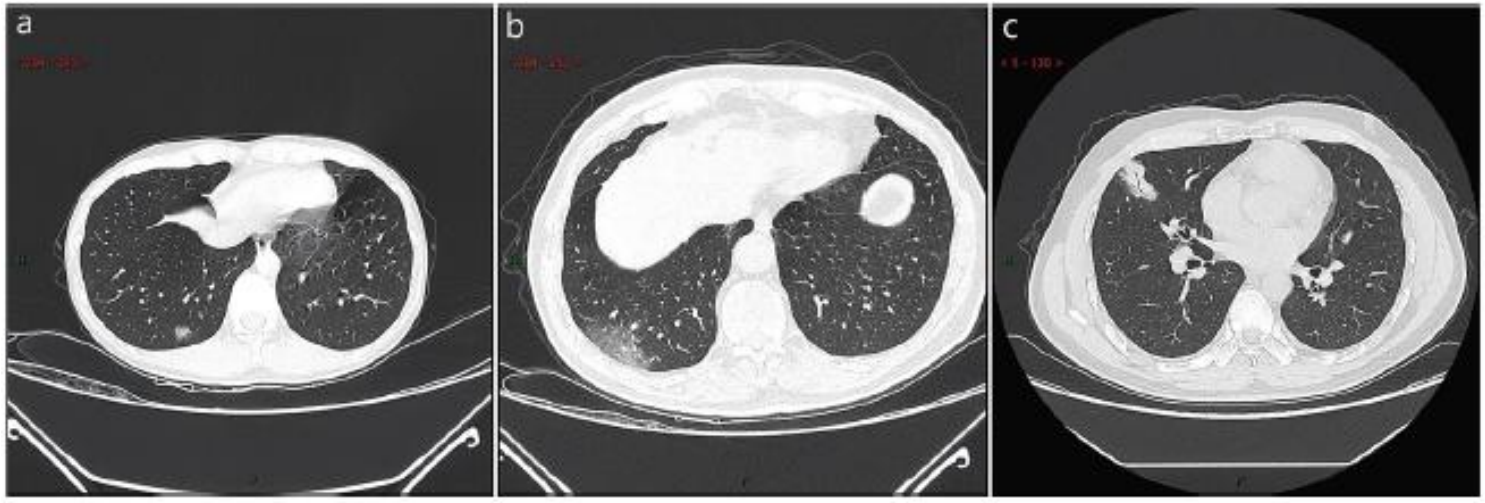
Bronchial dilatation + wall thickening

Courtesy of Dr SK Li & Dr YC Lee (Department of Radiology, PMH)

Staging by CT: Ultra- early stage

- 1-2 weeks after exposure
- No clinical manifestation
- -ve laboratory test
- +ve throat swab

- **Radiologic findings**:
  - Single, double or scattered focal ground-glass opacity
  - Nodules located in central lobule surrounded by patchy ground-glass opacities
  - patchy consolidation and sign of intra-bronchial air-bronchogram, which was dominant in the middle and lower pleura



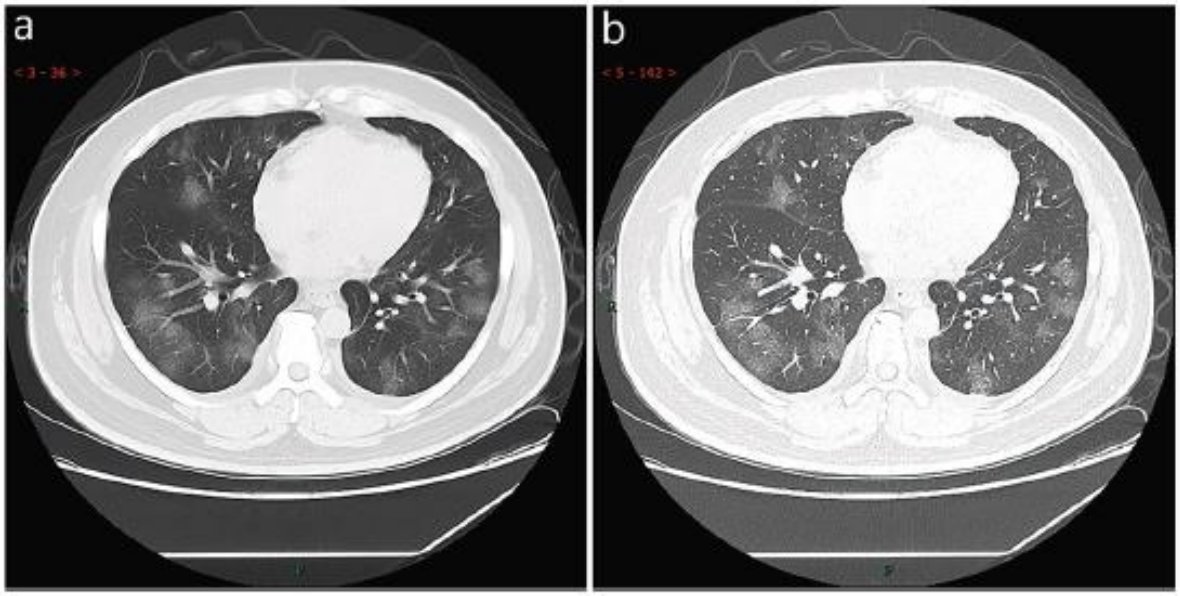
Jin YH, et al. ***Mil Med Res*** *2020;7(1) online 2020 Feb 6*

Staging by CT: Early stage

- 1–3 days after onset (fever, cough, dry cough, etc.).
- **Pathology**: dilatation and congestion of alveolar septal capillary, exudation of fluid in alveolar cavity and interlobular interstitial edema.

Radiologic findings:

- single or multiple scattered patchy or agglomerated **ground-glass opacities**, separated by honeycomb-like or grid-like **thickened of interlobular septa**



Jin YH, et al. ***Mil Med Res*** *2020;7(1) online 2020*

Staging by CT: Rapid progressive stage

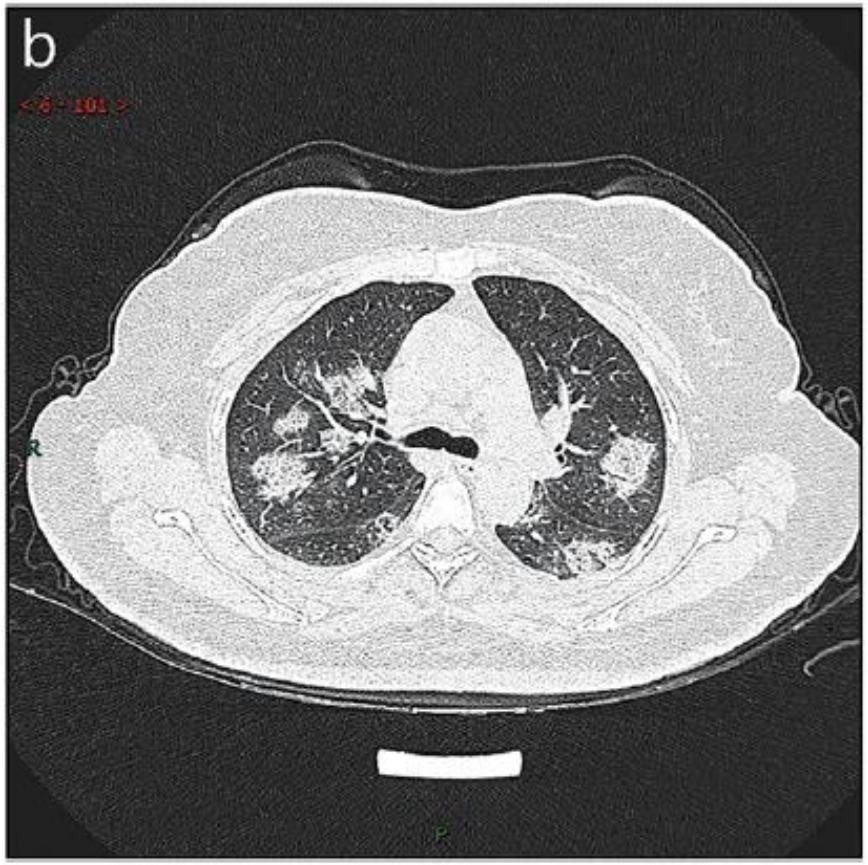
- 3–7 days after onset

Pathology:

- accumulation of a large number of cell-rich exudates in the alveolar cavity,
- vascular expansion and exudation in the interstitium,
- both lead to further aggravation of alveolar and **Interstitial edema**.
- The fibrous exudation connects each alveolus through the inter-alveolar space to form a fusion state.

Radiologic findings:

- A fused and large-scale **light consolidation** with **air-bronchogram** inside



Jin YH, et al. ***Mil Med Res*** *2020;7(1) online 2020*

Staging by CT: Consolidation stage

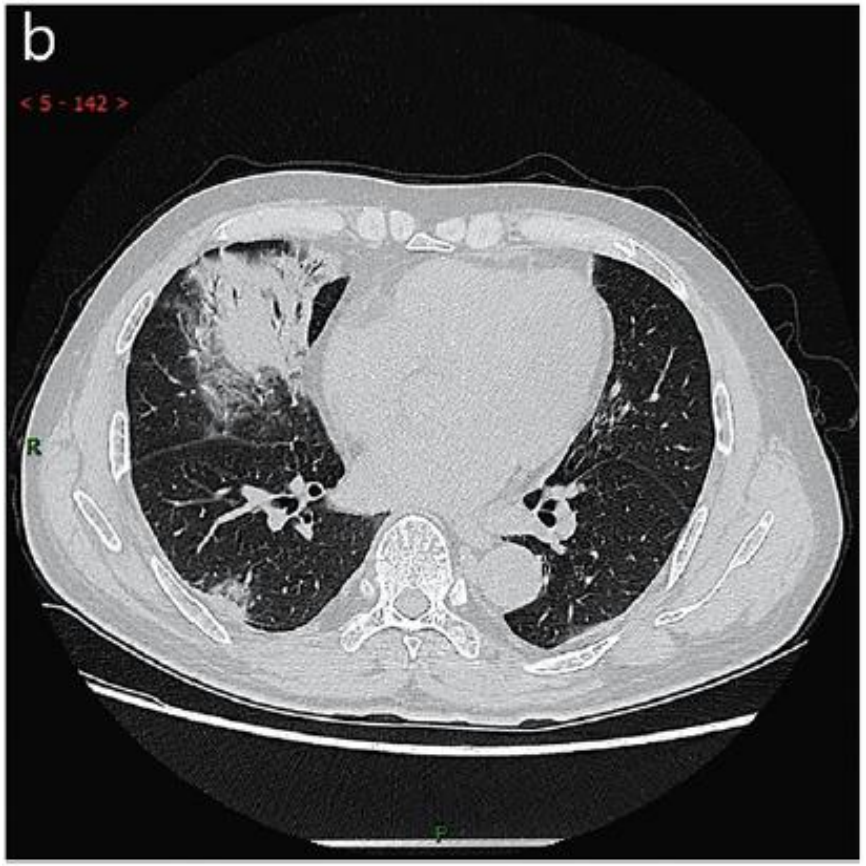
- 7-14 days after onset

Pathology:

- fibrous exudation of the alveolar cavity and the disappearance of capillary congestion in the alveolar wall.

Radiologic findings:

- multiple patchy **consolidations** in slighter density and smaller range than that of the previous stage



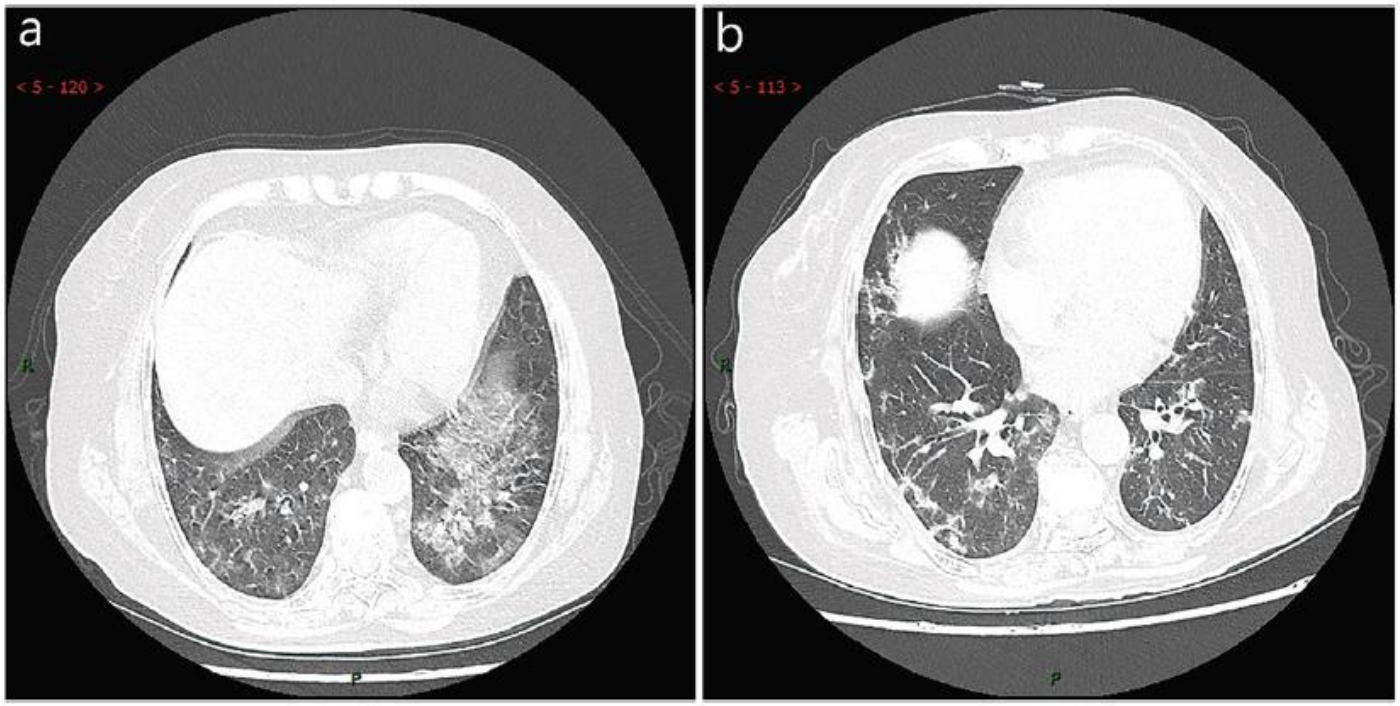
Jin YH, et al. ***Mil Med Res*** *2020;7(1) online 2020*

Staging by CT: Dissipation stage

- 2 and 3 weeks after the onset
- Range of lesions was further reduced.

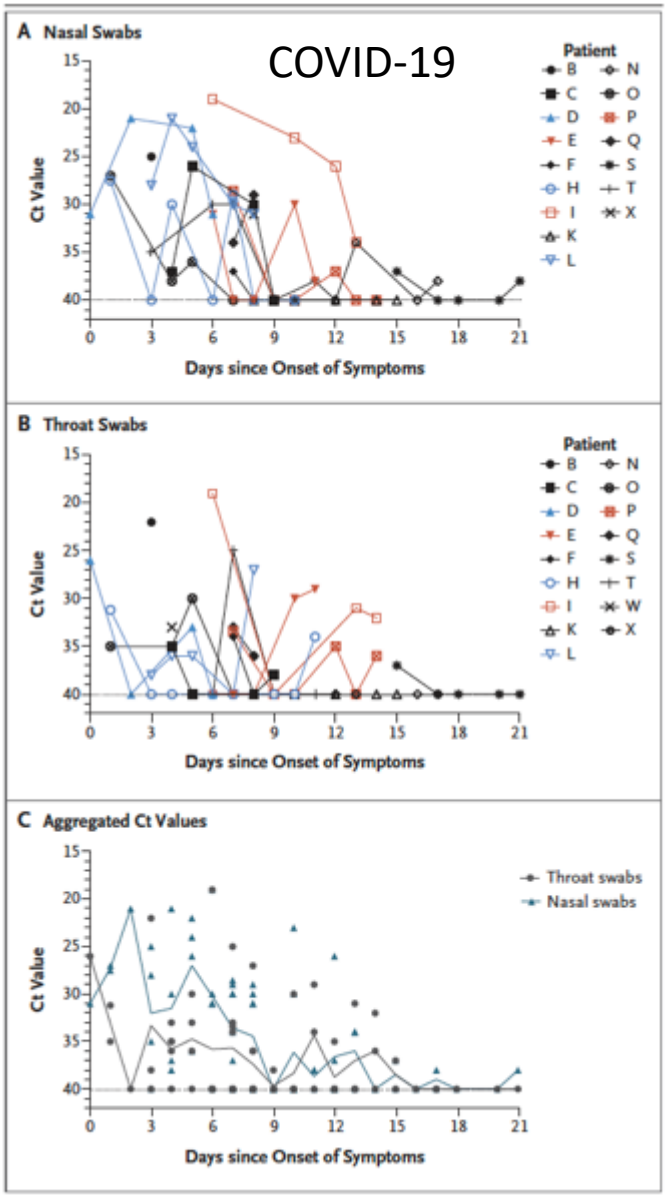
Radiologic findings:

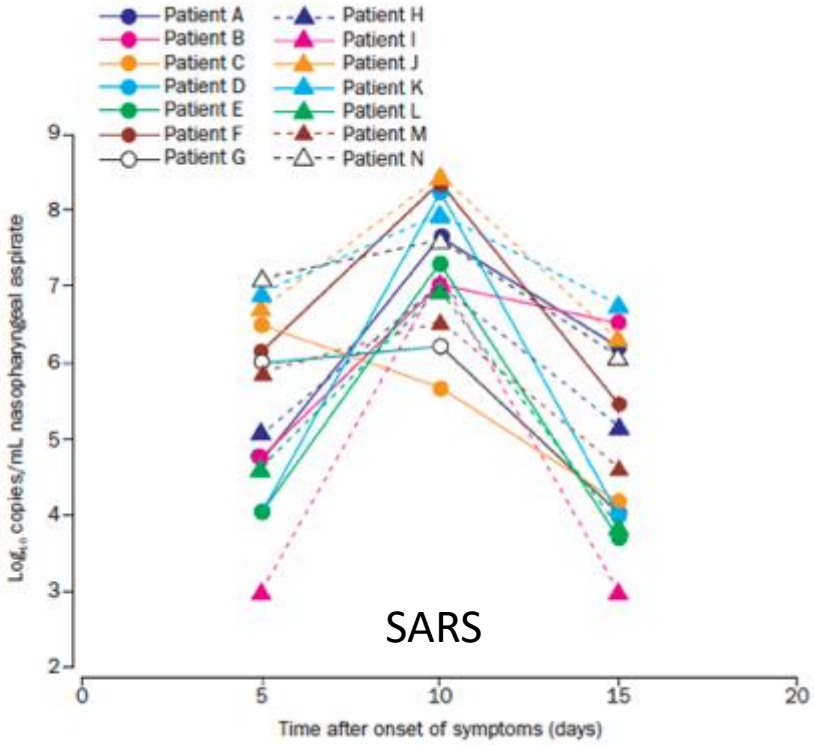
- patchy consolidation or strip-like opacity.
- As time goes on, it showed **grid-like thickening of interlobular septum**, thickening and strip-like twist of bronchial wall and a few scattered **patchy consolidations**



Jin YH, et al. ***Mil Med Res*** *2020;7(1) online 2020*

Viral shedding





- In general, downward trend for COVID-19.
- Vs SARS peaked at day 10

Clinical Management

- **General Clinical Management**
  - Monitor vital signs and organ functions, and recognize complication(s) early
  - Liaise with ICU early for intensive care if anticipate clinical deterioration
  - Provide supportive treatments
    - Antibacterial
    - Oxygen
    - *High-flow nasal oxygen (HFNO) or non-invasive ventilation (NIV) should only be used in selected patients with hypoxemia respiratory failure.*
    - IV fluid
    - Inotropic support +/-steroid* (septic shock)
    - Mechanical ventilation +/-ECMO (respiratory failure)

* ***Use of corticosteroids***
- *Do not routinely give systemic corticosteroids*
- *Use of short-period, stress dose steroids (hydrocortisone 200mg max daily) for refractory septic shock or other clinical indications on physician discretion*

Specific Treatment for **SARS and MERS**

Treatment Modalities	Study focus	Safety profile	Order of recommendation
Convalescent Plasma	**SARS**: Clinical, in vitro, animal **MERS**: in vitro, animal	**Good**	***1***
Interferon	**SARS**: Clinical, in vitro, animal **MERS**: Clinical, in vitro, animal	**Well established**	***1***
Protease inhibitors	**SARS**: Clinical, in vitro, animal **MERS**: Clinical, in vitro, animal	**Well established,** mild GI & liver toxicity	***1***
Monoclonal & polyclonal neutralizing Ab	**SARS**: in vitro, animal **MERS**: Clinical, in vitro, animal	**MERS:** SAB-301 (Safe)	***1***
Interferon + Ribavirin	**SARS**: Clinical, in vitro, animal **MERS**: Clinical, in vitro, animal	Hemoptysis with ribavirin	2
Nitazoxanide	**MERS**: in vitro	**Well established**	2
Chloroquine	**SARS**: in vitro, animal **MERS**: in vitro, animal	**Well established**	2
Corticosteroids	**SARS**: Clinical, animal **MERS**: Clinical	Prolonged viremia, nosocomial infection, VAP, increase mortality	3
IVIG, MMF or ribavirin monotherapy	Not conclusive in in vitro, animal or clinical	**Well established**	3

Evidence base for specific therapies for MERS-CoV infection :
1: **Benefit is likely to exceed risk**
2: **Data is inadequate for assessment**
3: **Risk is likely to exceed benefit**

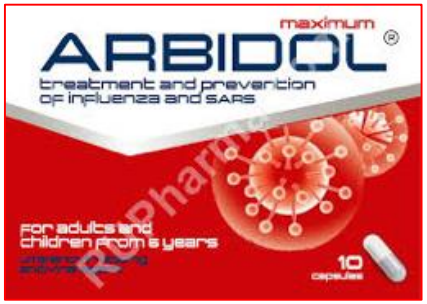
Clinical trials on **COVID-19** in China (>85)

- **Remdesivir**: Anti Ebola Rx
- **Kaletra**: HIV drug
- **Interferons**
- Influenza drugs:
  - **Oseltamivir**
  - **Baloxavir**
  - **Umifenovir (Arbidol)**
- **Chloroquine**: malaria drug
- **Novaferon**: Anti tumor IFN
- **Tenofovir:** HBV Rx
- **Traditional Chinese medicine**: lianhua qingwen



Potential specific anti-viral agents with available stocks in HA pharmacy

- **Kaletra** (Lopinavir/ritonavir): Anti-HIV Rx
- **Interferons** (interferon-*β,* interferon- γ)
- **Ribavirin**: synergistic effect with kaletra
- **Remdesivir**:
  - Improve both lung fx of Mice and reduce viral load
  - Clinical trail in China has been completed, pending for 28d outcome
  - 3 sites in HK for Gilead sponsored clinical trials: PMH, QMH and PWH

Remdesivir in cell culture (**MERS**)

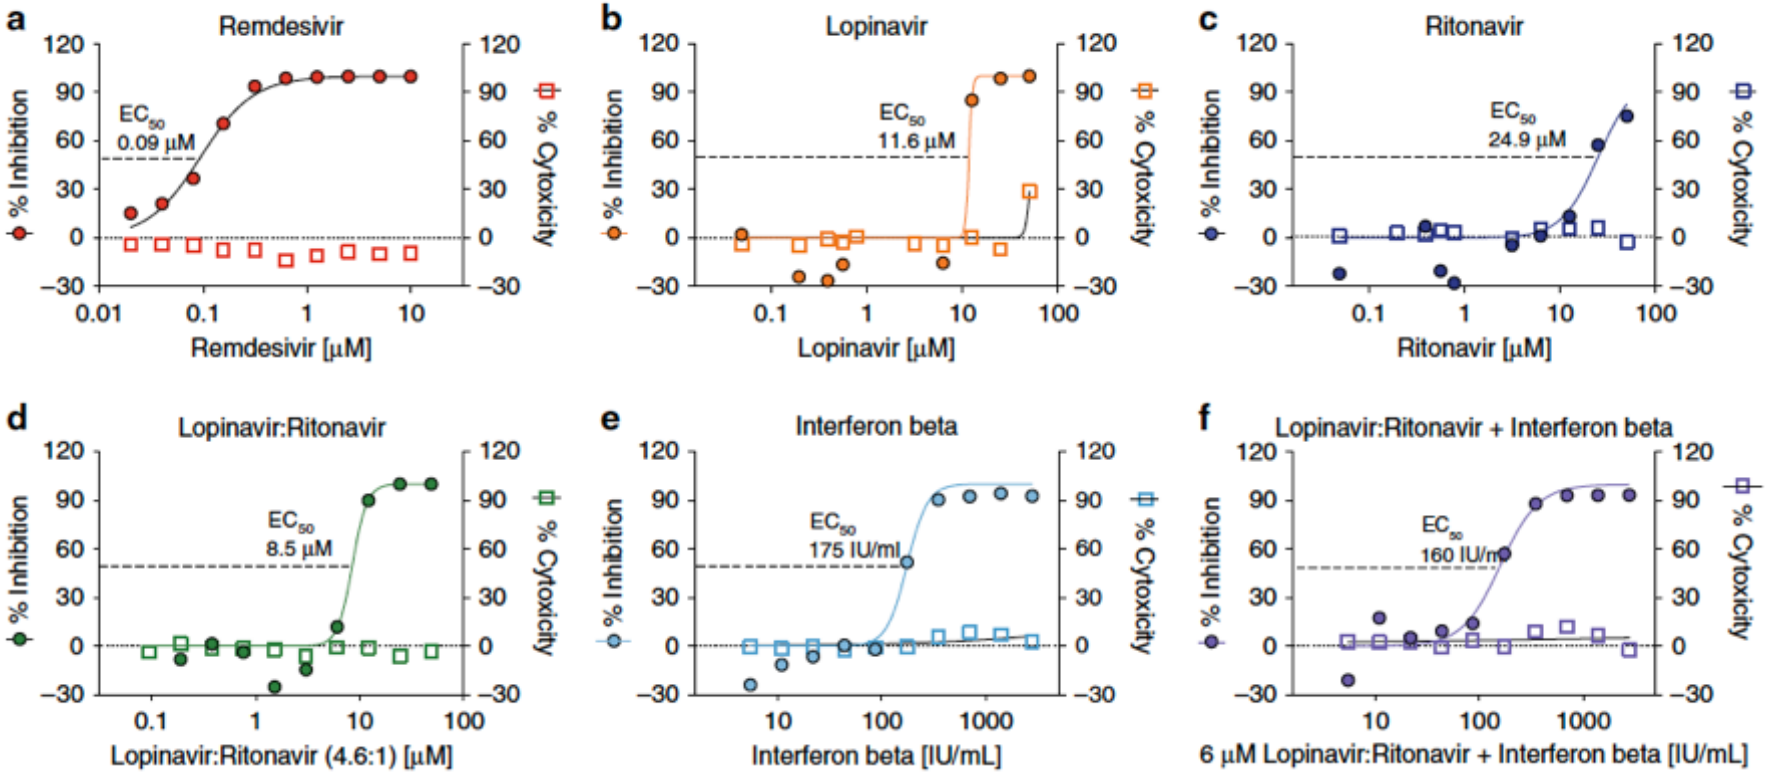

Fig. 1 RDV and IFNb have superior antiviral activity to LPV and RTV. Graphs depict mean % inhibition of MERS-CoV replication (left *Y*-axis) and % cytotoxicity (right *Y*-axis) of antivirals. Calu-3 cells were infected in sextuplicate with MERS-CoV nanoluciferase (nLUC) at a multiplicity of infection (MOI) of 0.08 in the presence of a dose response of drug for 48 h, after which replication was measured through quantitation of MERS-CoV–expressed nLUC. Cytotoxicity was measured in similarly treated but uninfected cultures via Cell-Titer-Glo assay. Representative data are shown from four independent experiments.

Kaletra in **MERS:** Non-human primates study

Kaletra & IFN

- improved clinical (mean clinical scores ↓50.9%–95.0%
- ↓weight loss
- XR: minimal pulmonary infiltrates
- Pathological: mild bronchointerstitial pneumonia
- Lower mean viral loads in necropsied lung (↓0.59–1.06 log copies/glyceraldehyde 3-phosphate dehydrogenase [GAPDH]; $P < .050$) and extrapulmonary tissue

MMF:

- All animals developed severe and/or fatal disease
- higher mean viral loads (↑0.15–0.54 log copies/GAPDH)

关于印发新型冠状病毒肺炎诊疗方案（试行第七版）的通知

国卫办医函〔2020〕184号

各省、自治区、直辖市及新疆生产建设兵团卫生健康委、中医药管理局：

为进一步做好新型冠状病毒肺炎病例诊断和医疗救治工作，我们组织专家在对前期医疗救治工作进行分析、研判、总结的基础上，对诊疗方案进行修订，形成了《新型冠状病毒肺炎诊疗方案（试行第七版）》。现印发给你们，请参照执行。各有关医疗机构要在医疗救治工作中积极发挥中医药作用，加强中西医结合，完善中西医联合会诊制度，促进医疗救治取得良好效果。

附件：新型冠状病毒肺炎诊疗方案（试行第七版）

国家卫生健康委办公厅
国家中医药管理局办公室
2020年3月3日

Antiviral treatment:

- Ribavirin + interferon-**α** (Inhalation) **or** lopinavir / ritonavir, for < 10 days
- **Chloroquine** phosphate (500mg, BD) for **7 days**
- **Arbidol** (200mg, tds) for < 10 days
- Continue to evaluate the efficacy of these drugs during use
- It is not recommended to use 3 or more antiviral drugs at the same time.
- Stop drugs when there are side effects

** Chloroquine & Arbidol are unregistered drugs in HK. Chloroquine is used for treatment of malaria but the quantity is small in HA. Arbidol is not available in HK*

Chloroquine use:

- Should be used strictly in accordance with the **expert consensus** and the **recommended dosage and duration** of use in the **6th edition** of treatment guideline
- The scope, dose and time of medication **should not be expanded**
- During the use of the drug, close observation is required.
- Adjust or discontinue when severe **adverse reactions** occur
- Clinical studies on chloroquine phosphate are carried out under the **guidance of designated hospitals**, scientific researchers and clinical doctors
- Limited to the treatment of **confirmed patients** who meet the eligibility criteria.
- **Prophylaxis therapy is not necessary** and is not indicated.

Interim Recommendation on Clinical Management of Adult Cases with Coronavirus Disease 2019 (COVID-19)

Version	Effective Date
1	13 February 2020

Document Number	CCIDER-COVID19-001(v1)
Author	HA Task Force on Clinical Management on Infection (TFCM)
Custodian	Central Committee on Infectious Diseases and Emergency Response (CCIDER)
Approved by	Central Committee on Infectious Diseases and Emergency Response (CCIDER)
Approval Date	13 February 2020
Next Review Date	13 February 2023

http://ha.home/ho/cico/Interim_Recommendation_on_Clinical_Management_of_Adult_Cases_with_COVID-19.pdf

Specific Antiviral treatment: principle

- There is no current evidence from randomized controlled trials to recommend any specific anti-COVID-19treatment for patients with confirmed COVID-19infection.
- Unlicensed treatment should be given under ethically-approved clinical trials as far as possible.
- In the absence of appropriate clinical trials, the following treatment regimens **may** be considered.
- These regimens are determined based on evidence extrapolated from research performed for other coronaviruses, expert opinion, as well as the availability of therapeutics in Hong Kong.
- This serves as an **interim** guidance, and will be updated according to the availability of new evidence or drug availability.

HA Antiviral Treatment guideline

lopinavir/ ritonavir 400mg/100mg (Kaletra) BD po for 14 days

+/-

Ribavirin 400mg BD po for 14 days

+/-

Interferon beta-1b 0.25mg subcutaneous every alternate day for 3 doses (D1-2, D3-4, D5-6 of symptom onset)

- Kaletra is considered as the backbone therapy.
- Additional use of other two drugs is based on in-charge hospital/ cluster Infectious Diseases Physician's discretion.
- Omit the remaining doses of interferon beta-1b when the symptom onset is beyond 7 days (e.g. if the patient presents on day 6 of symptoms onset, only one dose of interferon should be given)
- If patient presents with symptoms beyond 7 days, only ribavirin and kaletra should be given

Pre-treatment workup

6.3.6.1. Check blood x CBP, LRFT, RG, LDH, CK, HBsAg, anti-HCV, anti-HIV

6.3.6.2. + blood x TFT, ANA (for starting interferon)

6.3.6.3. CXR (+/- HRCT thorax if indicated)

6.3.6.4. ECG (if preexisting cardiac abnormalities or disease or clinically indicated). For patients with underlying pre-existing cardiac problems, follow-up monitoring of the cardiac condition is suggested.

6.3.6.5. Pregnancy test for females with reproductive potential (Before starting interferon or ribavirin)

6.3.6.6. Check any drug interactions with concomitant medications (in particular with ritonavir)

6.3.6.7. Obtain consent for treatment

Thanks
