Dying in a Leadership Vacuum

The Editors

Covid-19 has created a crisis throughout the world. This crisis has produced a test of leadership. With no good options to combat a novel pathogen, countries were forced to make hard choices about how to respond. Here in the United States, our leaders have failed that test. They have taken a crisis and turned it into a tragedy.

The magnitude of this failure is astonishing. According to the Johns Hopkins Center for Systems Science and Engineering,[1] the United States leads the world in Covid-19 cases and in deaths due to the disease, far exceeding the numbers in much larger countries, such as China. The death rate in this country is more than double that of Canada, exceeds that of Japan, a country with a vulnerable and elderly population, by a factor of almost 50, and even dwarfs the rates in lower-middle-income countries, such as Vietnam, by a factor of almost 2000. Covid-19 is an overwhelming challenge, and many factors contribute to its severity. But the one we can control is how we behave. And in the United States we have consistently behaved poorly.

We know that we could have done better. China, faced with the first outbreak, chose strict quarantine and isolation after an initial delay. These measures were severe but effective, essentially eliminating transmission at the point where the outbreak began and reducing the death rate to a reported 3 per million, as compared with more than 500 per million in the United States. Countries that had far more exchange with China, such as Singapore and South Korea, began intensive testing early, along with aggressive contact tracing and appropriate isolation, and have had relatively small outbreaks. And New Zealand has used these same measures, together with its geographic advantages, to come close to eliminating the disease, something that has allowed that country to limit the time of closure and to largely reopen society to a prepandemic level. In general, not only have many democracies done better than the United States, but they have also outperformed us by orders of magnitude.

Why has the United States handled this pandemic so badly? We have failed at almost every step. We had ample warning, but when the disease first arrived, we were incapable of testing effectively and couldn't provide even the most basic personal protective equipment to health care workers and the general public. And we continue to be way behind the curve in testing. While the absolute numbers of tests have increased substantially, the more useful metric is the number of tests performed per infected person, a rate that puts us far down the international list, below such places as Kazakhstan, Zimbabwe, and Ethiopia, countries that cannot boast the biomedical infrastructure or the manufacturing capacity that we have.[2] Moreover, a lack of emphasis on developing capacity has meant that U.S. test results are often long delayed, rendering the results useless for disease control.

Although we tend to focus on technology, most of the interventions that have large effects are not complicated. The United States instituted quarantine and isolation measures late and inconsistently, often without any effort to enforce them, after the disease had spread substantially in many communities. Our rules on social distancing have in many places been lackadaisical

Antiviral Treatments

Principles of Antiviral Treatments

- Early commencement of antiviral Combination therapy
  - Increase spectrum of activity
  - Increase potency
  - Reduce resistance emergence
- Rapid suppression of viral load
- Prevent subsequent complications
- Reduce viral shedding

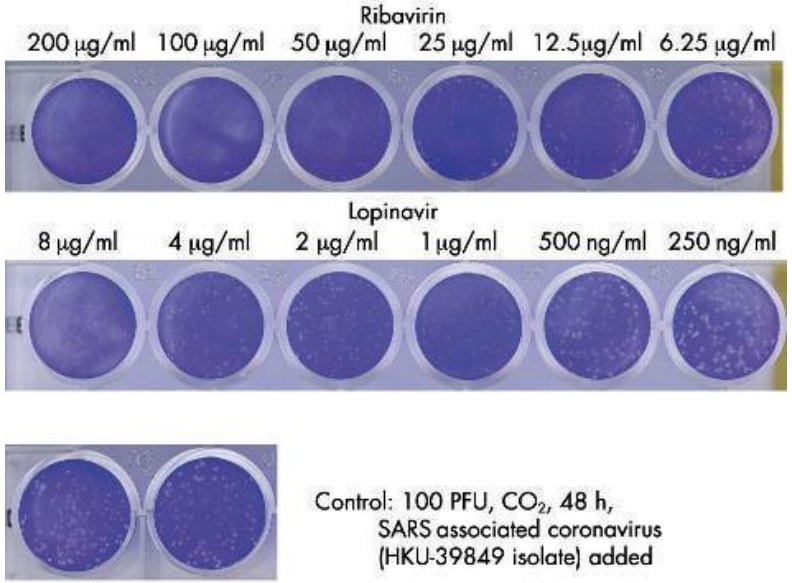
In Vitro Screening of Repurposed Drugs



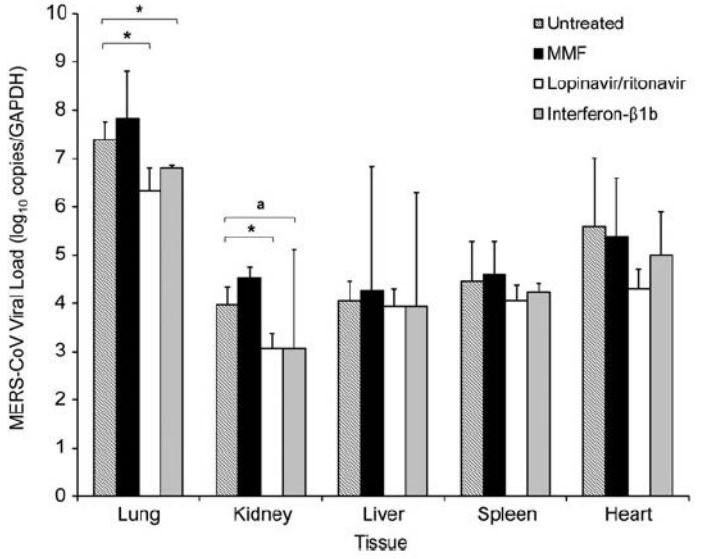


Figure 6. Mean viral loads with standard deviation values in different tissues of MERS-CoV-infected common marmosets collected at the time of necropsy. *P<.05. [a]Two of the 3 interferon-β1b-treated animals had undetected viral loads in necropsied kidney tissues, which accounted for a large standard deviation value and apparent lack of statistically significant difference from the mean viral load of the untreated animals. Abbreviations: GAPDH, glyceraldehyde 3-phosphate dehydrogenase; MERS-CoV, Middle East respiratory syndrome coronavirus; MMF, mycophenolate mofetil.

1. VL of COVID-19 peaks at presentation like influenza
2. Combination of multiple antiviral drugs is more effective
3. Three modestly active drugs against SARS-CoV-2

Repurposed Antiviral Drugs for Covid-19 – Interim WHO Solidarity Trial Results

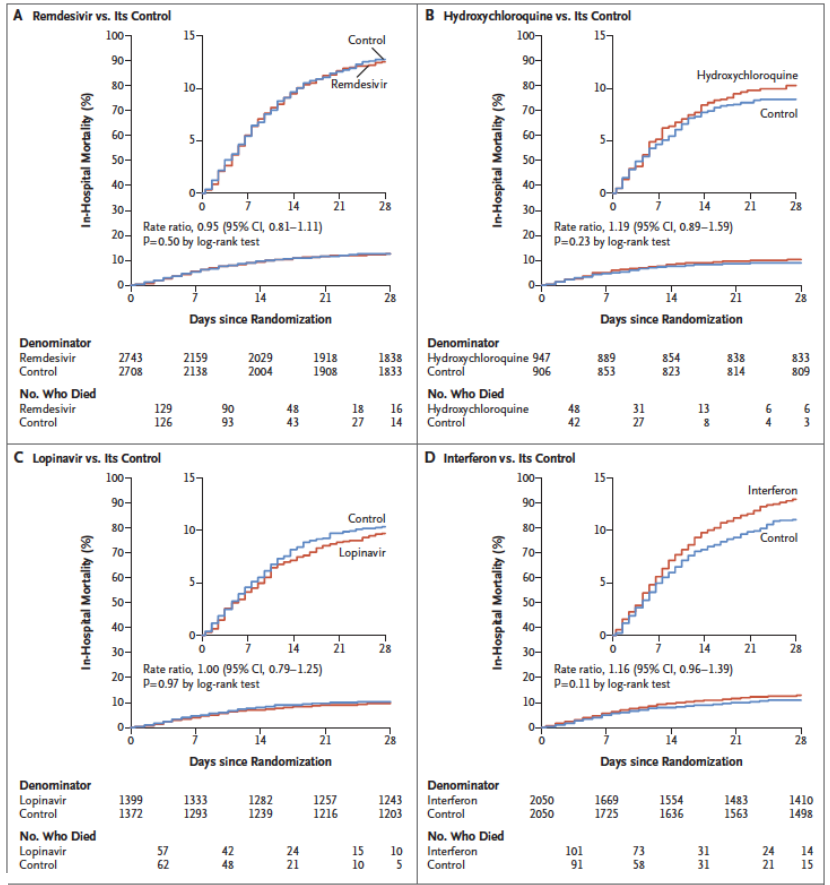

Figure 2. Effects of Remdesivir, Hydroxychloroquine, Lopinavir, and Interferon on In-Hospital Mortality.

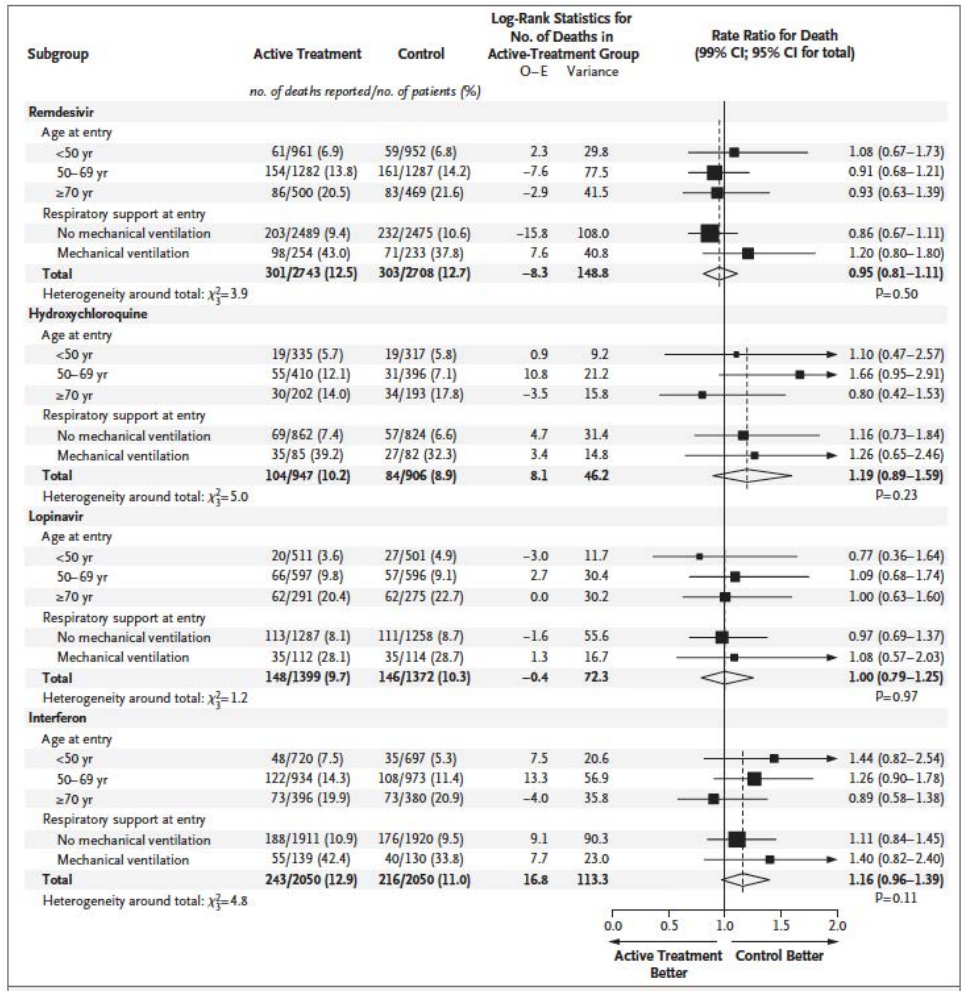
Shown are Kaplan–Meier graphs of in-hospital mortality at any time (the primary outcome), comparing each treatment with its control without standardization for any initial patient characteristics. Insets show the same data on an expanded y axis. The rate ratios for death were standardized for age and for ventilation status at entry. Denominators for the few events on day 0, but not thereafter, include patients with no follow-up. Numbers of deaths are by week, and then deaths after day 28. CI denotes confidence interval.



Subgroup	Active Treatment	Control	Log-Rank Statistics for No. of Deaths in Active-Treatment Group O–E	Variance	Rate Ratio for Death (99% CI; 95% CI for total)
	no. of deaths reported/no. of patients (%)

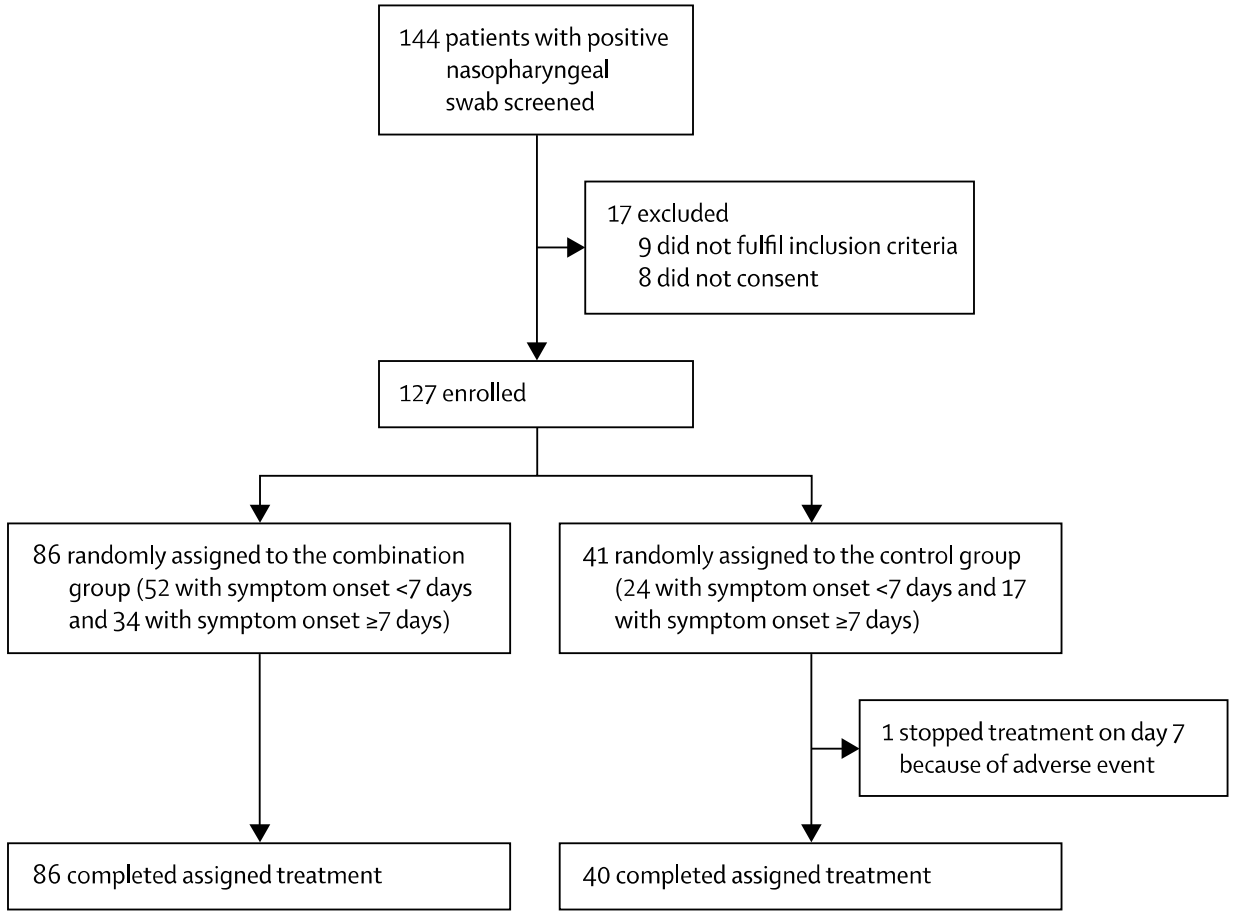
IFN beta-1b + lopinavir-ritonavir + ribavirin

Time from symptom onset to treatment
for triple therapy within combo group:
Median 4 days (3-6)

Median number of IFN beta-1b received: 2 doses



HKU Med

Hung IF et al. Lancet 2020:doi.org/10.1016/PII

IFN beta-1b + lopinavir-ritonavir + ribavirin

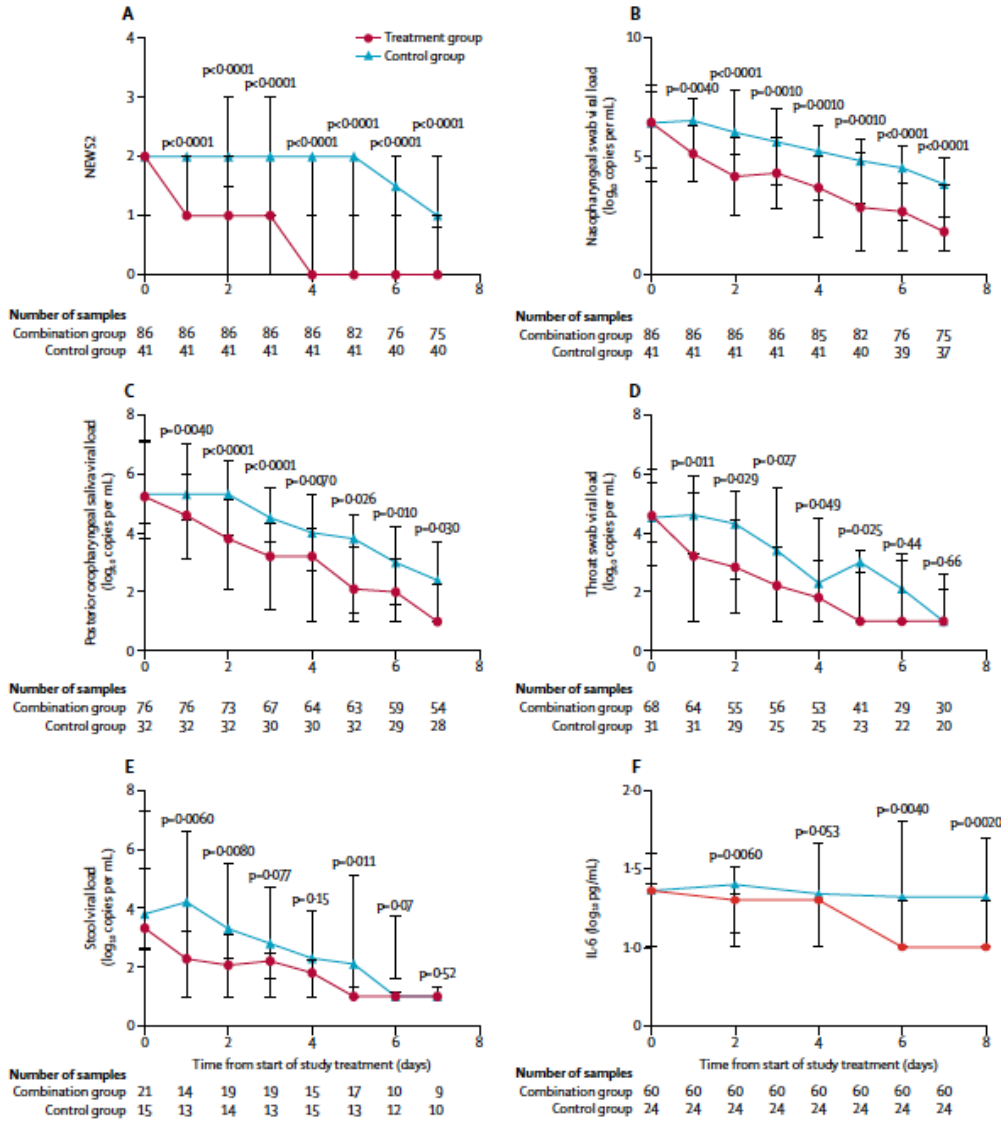
Primary outcome:
Combo group significantly shorter median time from start of treatment to negative NPS: 7 (5-11) vs. 12 (8-15) days

HR: 4.37 [95% CI 1.86-10.24} p=0.0010

No significant nsp5 mutations were identified in serial NPS

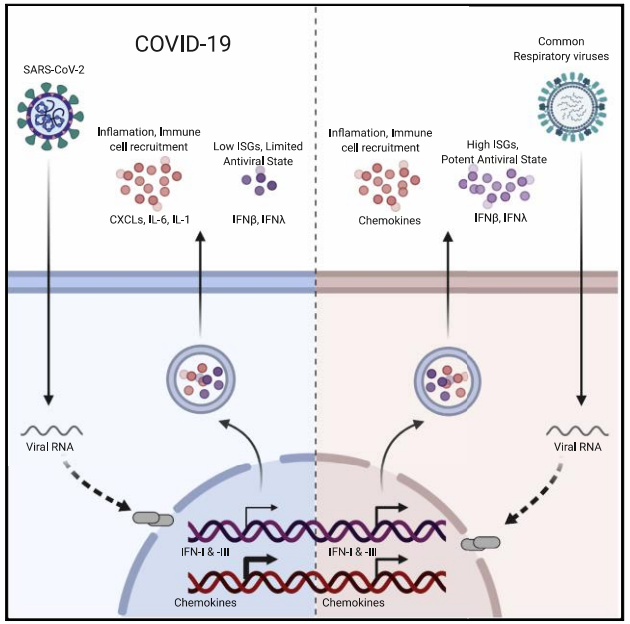
Few GI side effects and self-limiting

Conclusion:
IFN beta-1b based triple therapy is safe and superior to lopinavir-ritonavir alone



Hung IF et al. Lancet 2020:doi.org/10.1016/PII

Intrinsic Interferon in Covid-19



Highlights

- SARS-CoV-2 infection induces low IFN-I and -III levels with a moderate ISG response
- Strong chemokine expression is consistent across *in vitro*, *ex vivo*, and *in vivo* models
- Low innate antiviral defenses and high pro-inflammatory cues contribute to COVID-19

Meta-Analysis: Convalescent Blood Products for Spanish Influenza Pneumonia: A Future H5N1 Treatment?

Thomas C. Luke, MD, MTMH; Edward M. Kilbane, MD, MPH; Jeffrey L. Jackson, MD, MPH; and Stephen L. Hoffman, MD, DTMH

Background: Studies from the Spanish influenza era reported that transfusion of influenza-convalescent human blood products reduced mortality in patients with influenza complicated by pneumonia. Treatments for H5N1 influenza are unsatisfactory, and convalescent human plasma containing H5N1 antibodies could be an effective therapy during outbreaks and pandemics.

Purpose: To determine whether transfusion with influenza-convalescent human blood products reduced the risk for death in patients with Spanish influenza pneumonia.

Data Sources: Manual search of English-language journals from 1918 to 1925. Citations from retrieved studies were also searched.

Study Selection: Published English-language studies that had at least 10 patients in the treatment group, used convalescent blood products to treat Spanish influenza pneumonia in a hospital setting, and reported on a control or comparison group.

Data Extraction: Two investigators independently extracted data on study characteristics, outcomes, adverse events, and quality.

Data Synthesis: Eight relevant studies involving 1703 patients were found. Treated patients, who were often selected because of more severe illness, were compared with untreated controls with influenza pneumonia in the same hospital or ward. The overall crude case-fatality rate was 16% (54 of 336) among treated patients and 37% (452 of 1219) among controls. The range of absolute risk differences in mortality between the treatment and control groups was 8% to 26% (pooled risk difference, 21% [95% CI, 15% to 27%]). The overall crude case-fatality rate was 19% (28 of 148) among patients who received early treatment (after <4 days of pneumonia complications) and 59% (49 of 83) among patients who received late treatment (after ≥4 days of pneumonia complications). The range of absolute risk differences in mortality between the early treatment group and the late treatment group was 26% to 50% (pooled risk difference, 41% [CI, 29% to 54%]). Adverse effects included chill reactions and possible exacerbations of symptoms in a few patients.

Limitations: Studies were few and had many methodologic limitations. No study was a blinded, randomized, or placebo-controlled trial. Some pertinent studies may have been missed.

Conclusions: Patients with Spanish influenza pneumonia who received influenza-convalescent human blood products may have experienced a clinically important reduction in the risk for death. Convalescent human H5N1 plasma could be an effective, timely, and widely available treatment that should be studied in clinical trials.

COVID-19 Convalescent Plasma

EAP to EUA transition

All program forms must be completed and submitted by November 30, 11:59 CST. Any uncompleted work will be submitted to the central IRB as a potential non-compliance.

Due to the overwhelming volume of program inquiries, it may take longer to receive a response. We appreciate your patience as we work through our communications backlog.

The US COVID Plasma Team is currently focused on collecting missing information and verifying the accuracy of information for each patient enrolled in the EAP.

Top priorities

1. Ensuring information on the patient is accurate
2. Ensuring physician information is accurate

Complete data is vital

We will improve the accuracy of patient data by:

- Pursuing delinquent reporting by physicians
- Obtaining missing medical history information

Historical EAP program participation

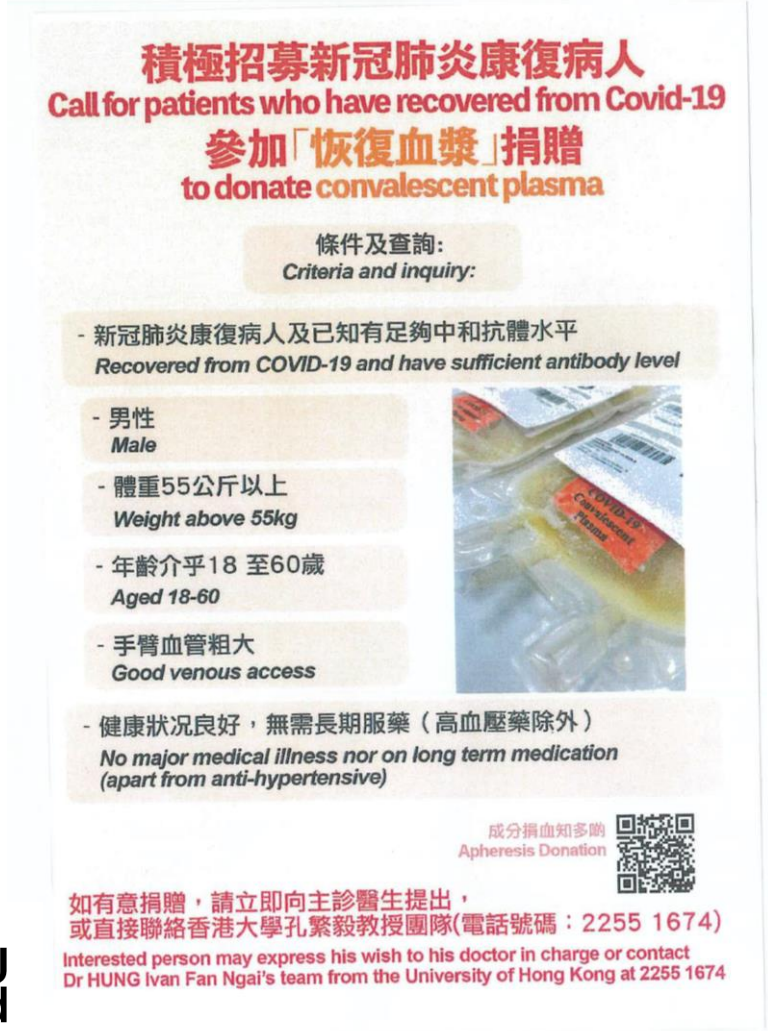
Convalescent Plasma Donation in HK



豬流感康復者血漿 提煉高免疫球蛋白

豬流感康復者血漿 提煉高免疫球蛋白

港大聯同多個醫療機構，研究提煉高免疫球蛋白，治療嚴重豬流感患者。 (蔡雄賢攝)

為了應付人類豬流感第二波的爆發，香港大學聯同多個醫療機構，收集人類豬流感康復者的血漿，提煉出高免疫球蛋白，用來醫治嚴重人類豬流感患者。

現時治療人類豬流感主要是用抗病毒藥物特敏福等，香港大學醫學院內科學系臨床助理教授孔繁毅表示，最近有研究顯示人類豬流感病人對抗流感藥物特敏福出現抗藥性，另一種吸入式的藥物樂感清，較難用於有肺部實質化的嚴重患者身上。

香港大學會聯同醫管局、紅十字會和衞生防護中心將展開以高免疫球蛋白的研究計劃，研究需收集人類豬流感康復者的血漿，製成可透過靜脈注射的高免疫球蛋白，用來醫治嚴重人類豬流感患者。

蛋白可在明年一月完成

高免疫球蛋白需 8 周製造，儲存期為兩年，希望可在明年 1 月前，製造出有關的蛋白。提煉血漿治病已有超過 100 年的歷史，在 1918 年西班牙 H1N1 流感大爆發時亦是提煉血漿治病。這是全球首次使用抗人類豬流感免疫球蛋白治療嚴重人類豬流感患者。

是項研究計劃將分兩個階段進行。第一階段主要是招募已康復之病人、篩選和收集血漿，並提煉成高免疫球蛋白。預計找出有 640 名捐贈者，收集 420 升的血漿。

紅十字會會主動聯絡人類豬流感的康復者，最快可在下周進行收集的程序。

而第二階段則是利用此高免疫球蛋白以治療嚴重人類豬型流感患者。

研究人員會在冬季時，進行一項雙盲研究，將收集到的血漿，提煉成高免疫球蛋白，並注射入 63 名嚴重人類豬流感的患者身上，同時亦有 63 名嚴重患者接受普通免疫球蛋白的治療，以評估高免疫球蛋白的成效，分析有關的死亡率、深切治療日數、留院日數、病毒數量和肺部損壞程度。

Convalescent Plasma Therapy

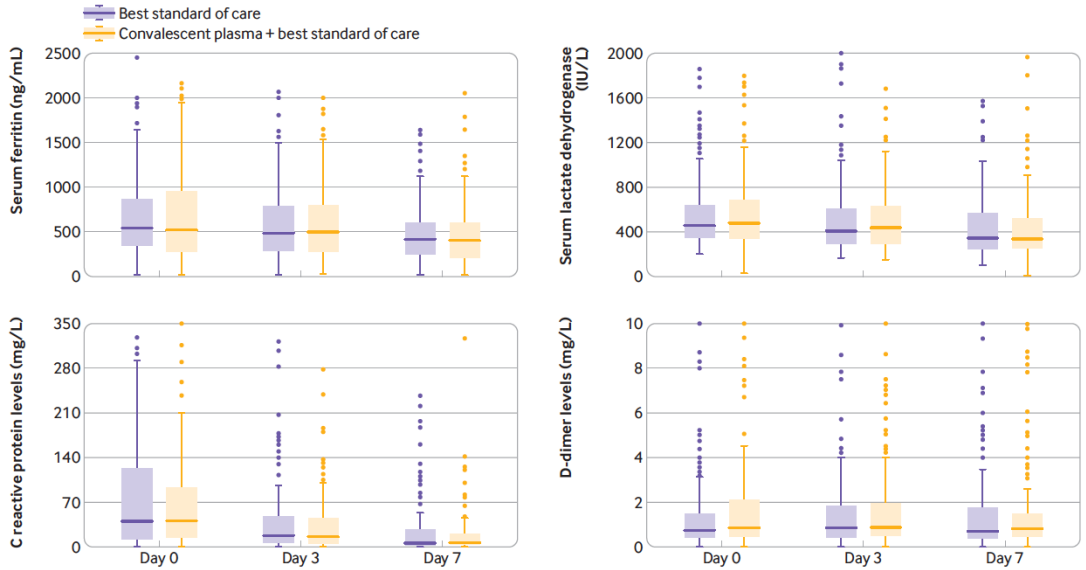

Fig 2 | Comparison of biomarkers between intervention (convalescent plasma therapy+best standard of care) and control (best standard of care) arms, by days post-enrolment. The dark line in the box represents the median and the upper and lower edges of the box represent the interquartile range. The upper and lower extreme of the whiskers represent the upper and lower range, respectively, excluding outliers

Table 3 | Comparison of primary outcomes between convalescent plasma therapy (intervention arm) and best standard of care (control arm) in intention-to-treat analysis

Composite outcome	No (%) in intervention arm (n=235)	No (%) in control arm (n=229)	Unadjusted risk difference (95% CI)	Unadjusted risk ratio (95% CI)	Adjusted risk ratio (95% CI)
All cause mortality at 28 days or progression to severe disease	44 (19)	41 (18)	0.008 (–0.062 to 0.078)	1.04 (0.71 to 1.54)	1.07 (0.73 to 1.58)

Adjusted for trial sites and presence of diabetes mellitus.

Table 4 | Comparison of secondary outcomes between convalescent plasma therapy (intervention arm) and best standard of care (control arm) in per protocol analysis (n=451). Values are numbers (percentages) unless stated otherwise

Secondary outcomes	Intervention arm	Control arm	Unadjusted risk ratio (95% CI)
Resolution of symptoms on day 7:			
Shortness of breath (n=362)	140/183 (76)	119/181 (66)	1.16 (1.02 to 1.32)
Fever (n=138)	66/67 (98)	65/71 (92)	1.08 (0.99 to 1.16)
Cough (n=274)	102/127 (80)	111/147 (76)	1.06 (0.94 to 1.2)
Fatigue (n=306)	114/156 (73)	92/153 (60)	1.21 (1.02 to 1.42)
Negative conversion of SARS-CoV-2 RNA:			
Day 3 (n=367)	79/184 (43)	67/183 (37)	1.2 (0.9 to 1.5)
Day 7 (n=342)	117/173 (68)	93/169 (55)	1.2 (1.04 to 1.5)
Median (interquartile range) total hospital stay (days); No with event	14 (10-19); n=227	13 (10-18); n=224	0.2*
Median (interquartile range) total days of respiratory support; No with event	9 (6-13); n=227	10 (6-13); n=224	0.7*
Median (interquartile range) days of respiratory support post-enrolment; No with event	6 (3-9); n=227	6 (4-10); n=224	0.5*
Type of mechanical ventilation during hospital stay:			
Invasive	19/227 (8)	19/224 (8)	0.99 (0.54 to 1.81)
Non-invasive	31/227 (14)	37/224 (16)	0.8 (0.5 to 1.3)
Vasopressor support after enrolment	10/225 (4)	8/221 (4)	1.2 (0.5 to 3.05)

SARS-CoV-2=severe acute respiratory syndrome coronavirus 2; RNA=ribonucleic acid.
*Continuous variables—Mann-Whitney U test applied and P values reported. All changes are measured from day of enrolment.

Death	25 (11)	12 (11.4)		
Invasive ventilatory support	19 (8.3)	10 (9.5)		
Hospitalized with supplemental oxygen requirement	5 (2.2)	2 (1.9)		
Hospitalized without supplemental oxygen requirement	8 (3.5)	1 (1)		
Discharged without full return to baseline physical function	30 (13.2)	8 (7.6)		
Discharged with full return to baseline physical function	141 (61.8)	72 (68.6)		
Secondary Outcomes				
Median time from intervention (IQR) — days				
To hospital discharge	13 (8–30)	12 (7–ND)	Subhazard ratio, 1 (0.76–1.32)	—
To discharge from the ICU	ND (8–ND)	ND (6–ND)	Subhazard ratio, 0.94 (0.48–1.82)	—
To complete restoration of physical functions†	15 (9–ND)	15 (7–ND)	Subhazard ratio, 0.89 (0.66–1.18)	—
To start of invasive ventilation	ND (9–ND)	ND	Subhazard ratio, 1.14 (0.72–1.81)	—
To death	ND	ND	Hazard ratio, 0.93 (0.47–1.86)	—
To improvement of 2 categories in the ordinal outcome or hospital discharge within 30 days	12 (7–29)	12 (6–ND)	Hazard ratio, 1 (0.76–1.32)	—
Adverse events — no (%)				
Any event	153 (67.1)	66 (62.9)	Odds ratio, 1.21 (0.74–1.95)	—
Serious event	54 (23.7)	19 (18.1)	Odds ratio, 1.40 (0.78–2.51)	—
Infusion-related event	13 (5.7)	2 (1.9)	Odds ratio, 3.13 (0.69–14.11)	—

A Randomized Trial of Convalescent Plasma in Covid-19 Severe Pneumonia

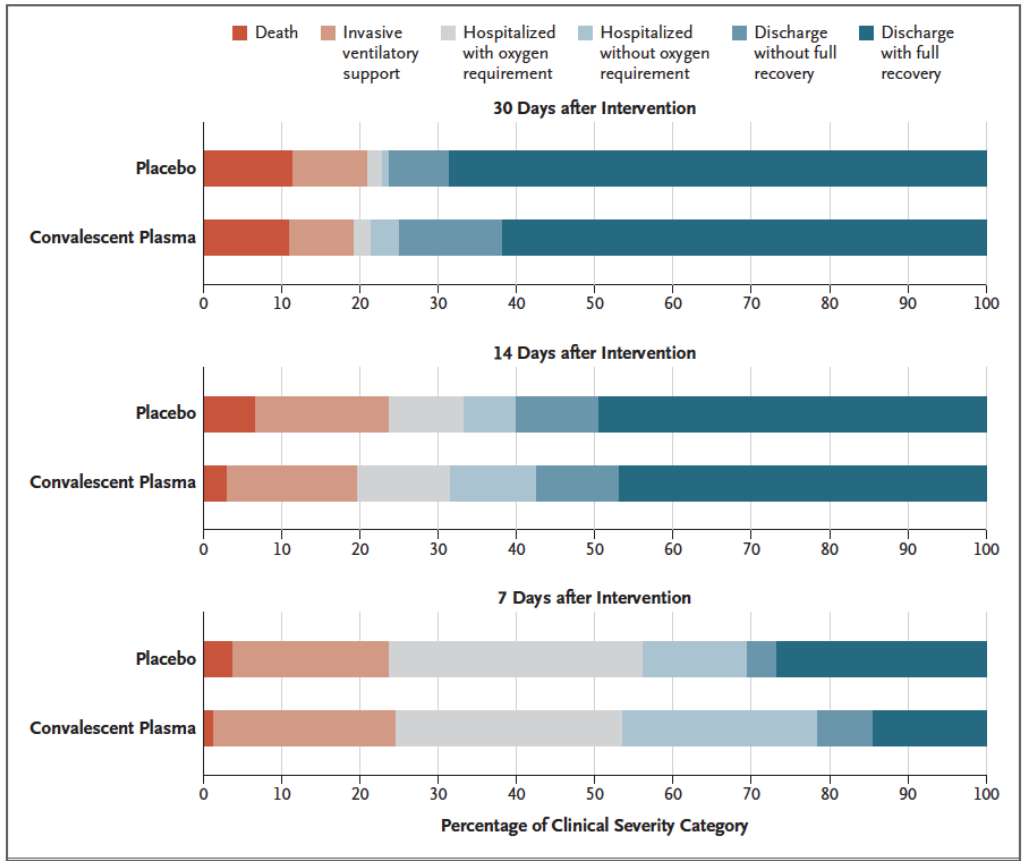

Figure 2. Clinical Outcomes among Patients Treated with Convalescent Plasma as Compared with Placebo.
The distribution of the clinical status according to the ordinal scale is shown at 30 days, 14 days, and 7 days after the intervention.

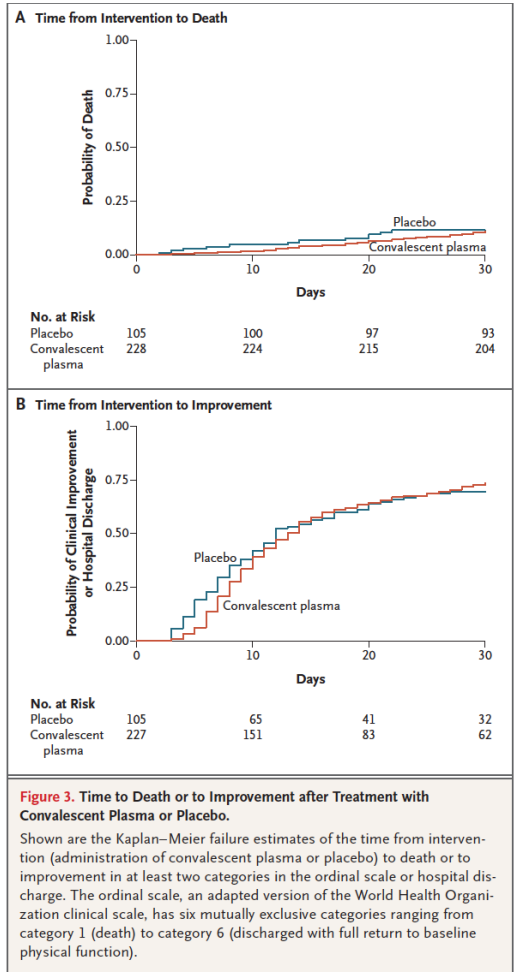

Figure 3. Time to Death or to Improvement after Treatment with Convalescent Plasma or Placebo.
Shown are the Kaplan–Meier failure estimates of the time from intervention (administration of convalescent plasma or placebo) to death or to improvement in at least two categories in the ordinal scale or hospital discharge. The ordinal scale, an adapted version of the World Health Organization clinical scale, has six mutually exclusive categories ranging from category 1 (death) to category 6 (discharged with full return to baseline physical function).

REGN-CoV2 Antibody Cocktail

- Two monoclonal Ab: REGN10933
  and REGN10987
- Derived from humanized mice and human convalescent plasma
- Ab against SARS-CoV-2 spike protein
- Two Ab to prevent rapid mutational escape
- RECOVERY trial

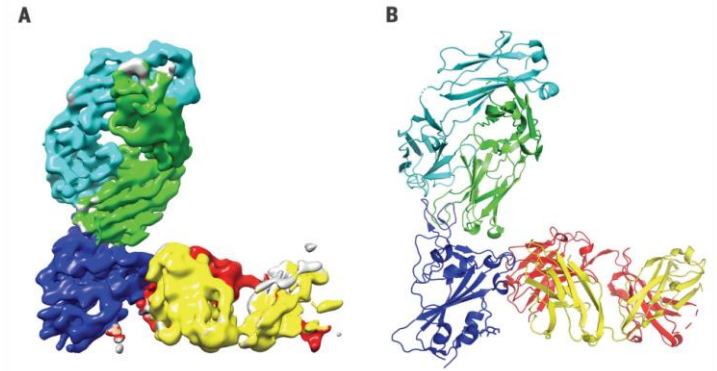

Fig. 4. Complex of REGN10933 and REGN10987 with the SARS-CoV-2 RBD. (A) 3.9-Å cryo-EM map of the REGN10933-RBD-REGN10987 complex, colored according to the chains in the refined model (B). RBD is colored dark blue; REGN10933 heavy and light chains are green and cyan, respectively; and REGN10987 heavy and light chains are yellow and red, respectively.

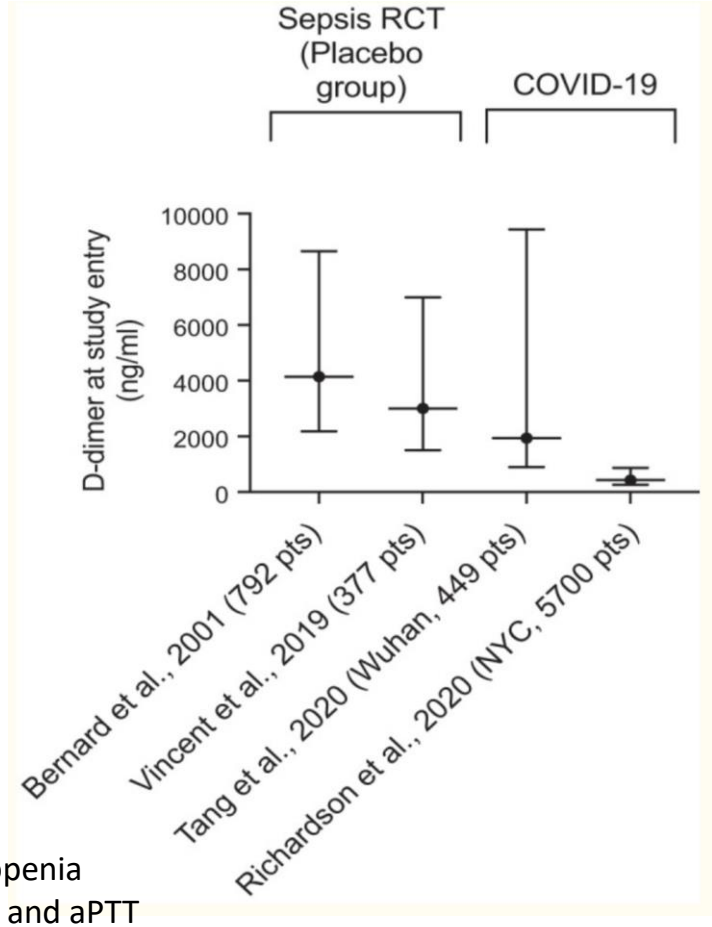
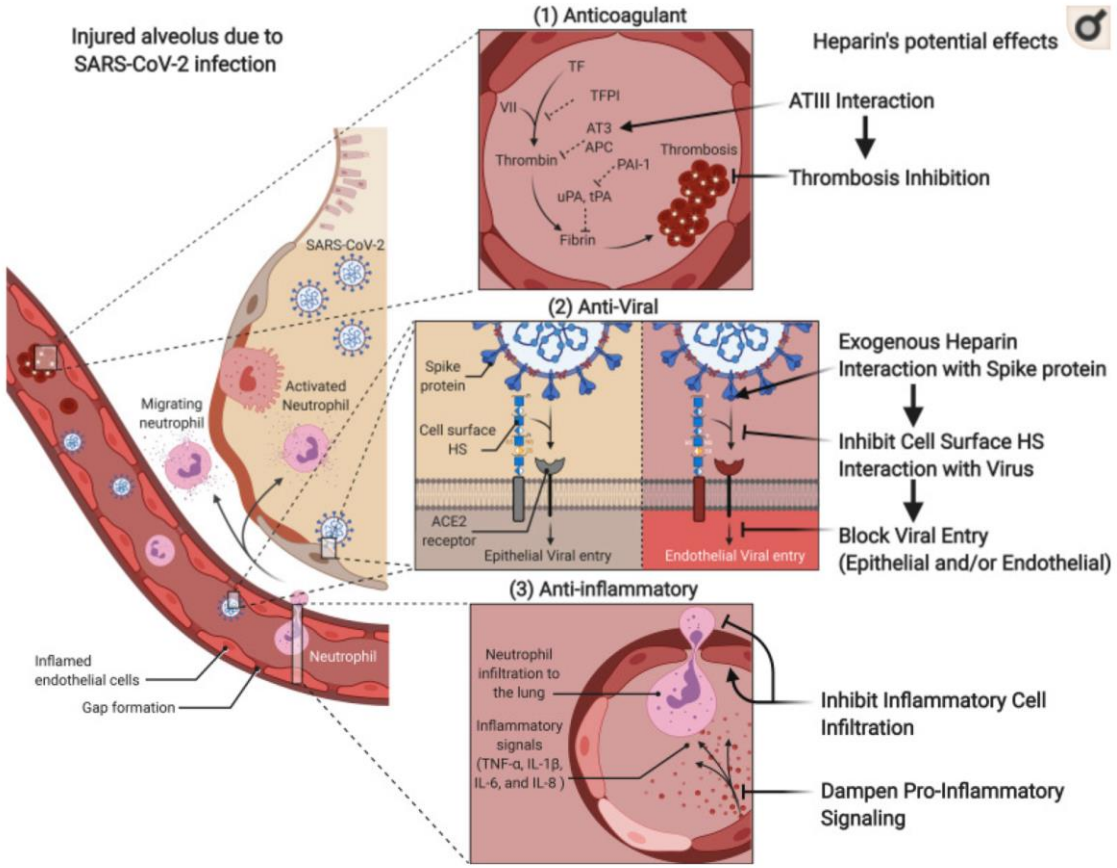
Heparin as a therapy for COVID-19: current evidence and future possibilities





Coagulopathy

1. Thrombocytopenia
2. Prolonged PT and aPTT
3. Raised D-dimer and fibrinogen
4. Endothelial injury, microangiopathy

Adverse effects

1. 10-15% bleeding risks
2. Heparin induced thrombocytopenia

Show/Hide Columns

Row	Saved	Status	Study Title	Conditions	Interventions	Locations
1	☐	Recruiting	Nebulized **Heparin** in Severe Acute Respiratory Syndrome **COVID-19**	• **Covid19** • Pneumonia	• Drug: Heparin sodium • Drug: Enoxaparin	• Clinica San Camilo Ciudad Autonoma de Buenos Aire, Buenos Aires, Argentina
2	☐	Not yet recruiting	Clinical Efficacy of **Heparin** and Tocilizumab in Patients With Severe **COVID-19** Infection: a Randomized Clinical Trial	• **Covid19**	• Drug: Tocilizumab • Drug: Heparin - Therapeutic dosage • Drug: Heparin - Prophylactic dosage	
3	☐	Recruiting	**Heparins** for Thromboprophylaxis in **COVID-19** Patients: HETHICO Study in Veneto	• **COVID-19** • Hypercoagulability	• Drug: Low Molecular Weight Heparin	• Giuseppe Camporese Padova, Italy
4	☐	Recruiting	Efficacy Assessment of Methylprednisolone and **Heparin** in Patients With **COVID-19** Pneumonia	• **COVID-19**	• Drug: Methylprednisolone • Drug: Heparin	• D'Or Institute for Research and Education Rio de Janeiro, Brazil
5	☐	Recruiting NEW	Inhaled **Heparin** for Hospitalised **COVID-19** Patients	• **Covid19**	• Drug: Unfractionated heparin	• San Camilo Clinic Buenos Aires, Argentina • 15th May hospital Cairo, Egypt
6	☐	Recruiting	Nebulised **Heparin** in Patients With Severe **COVID-19**	• **Covid19** • Respiratory Failure	• Drug: Nebulised unfractionated heparin (UFH)	• Frederick Health Hospital Frederick, Maryland, United States
7	☐	Recruiting	Full Dose **Heparin** Vs. Prophylactic Or Intermediate Dose **Heparin** in High Risk **COVID-19** Patients	• **Sars-CoV2** • **COVID**	• Drug: Enoxaparin • Drug: Prophylactic/Intermediate Dose Enoxaparin	• Beth Israel Newark Newark, New Jersey, United States • Southside Hospital Bay Shore, New York, United States • Huntington Hospital Huntington, New York, United States • (and 3 more...)
8	☐	Enrolling by invitation	Nebulized **Heparin** for the Treatment of **COVID-19** Induced Lung Injury	• **Covid-19** • ARDS, Human • Acute Lung Injury	• Drug: Heparin • Drug: 0.9% Sodium-chloride	• Frederick Health Hospital Frederick, Maryland, United States
9	☐	Not yet recruiting NEW	Factor Xa Inhibitor Versus Standard of Care **Heparin** in Hospitalized Patients With **COVID-19** (XACT)	• **Covid19**	• Drug: Enoxaparin • Drug: Rivaroxaban	
10	☐	Recruiting	D-dimer Adjusted Versus Therapeutic Dose Low-molecular-weight **Heparin** in Patients With **COVID-19** Pneumonia	• Coronavirus Disease (**COVID**)19	• Drug: low-molecular-weight heparin	• Faculty of Medicine Ain Shams University Research Institute- Clinical Research Center Cairo, Non-US, Egypt
11	☐	Not yet recruiting	Steroids and Unfractionated **Heparin** in Critically Ill Patients With Pneumonia From **COVID-19** Infection	• **Covid19** • SARS-CoV Infection • Pneumonia, Viral • Coagulopathy	• Drug: Enoxaparin • Drug: Methylprednisolone • Drug: unfractionated heparin	
12	☐	Not yet recruiting	Early Prophylactic Low-molecular-weight **Heparin** (LMWH) in Symptomatic **COVID-19** Positive Patients	• **COVID-19**	• Drug: Enoxaparin	
13	☐	Active, not recruiting	Intranasal **Heparin** Tolerability Study	• **Covid19**	• Drug: Intranasal heparin sodium (porcine)	• The University of Mississippi National Center for Natural Products Research University, Mississippi, United States

5

Conclusions

Conclusion

Antivirals

- More robust multicenter trials with similar ICU support needed
- Early commencement of combination of antiviral treatment
- Prevention of deterioration
- Focus in high risk population and elderly
- Profile in viral load and inflammatory markers
- Novel antiviral therapies

Vaccines

- Long-term efficacy of vaccines
- Safety profile
- Viral mutations
- Combination of vaccine antigens
